Important notes:

- The IO-Link Community Rules shall be considered prior to the development and marketing of IO-Link products. The document can be downloaded from the www.io-link.com portal.
- Any IO-Link device shall provide an associated IODD file.
- Any device which uses the IODD as device description shall provide easy access to the file and potential updates. It is the responsibility of the device manufacturer to test the IODD file with the help of the IODD-Checker tool available per download from www.io-link.com.

Disclaimer:

The attention of adopters is directed to the possibility that compliance with or adoption of IO-Link Community specifications may require use of an invention covered by patent rights. The IO-Link Community shall not be responsible for identifying patents for which a license may be required by any IO-Link Community specification, or for conducting legal inquiries into the legal validity or scope of those patents that are brought to its attention. IO-Link Community specifications are prospective and advisory only. Prospective users are responsible for protecting themselves against liability for infringement of patents.

The information contained in this document is subject to change without notice. The material in this document details an IO-Link Community specification in accordance with the license and notices set forth on this page. This document does not represent a commitment to implement any portion of this specification in any company's products.

WHILE THE INFORMATION IN THIS PUBLICATION IS BELIEVED TO BE ACCURATE, THE IO-LINK COMMUNITY MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL INCLUDING, BUT NOT LIMITED TO ANY WARRANTY OF TITLE OR OWNERSHIP, IMPLIED WARRANTY OF MERCHANTABILITY OR WARRANTY OF FITNESS FOR PARTICULAR PURPOSE OR USE.

In no event shall the IO-Link Community be liable for errors contained herein or for indirect, incidental, special, consequential, reliance or cover damages, including loss of profits, revenue, data or use, incurred by any user or any third party. Compliance with this specification does not absolve manufacturers of IO-Link equipment, from the requirements of safety and regulatory agencies (TÜV, BIA, UL, CSA, etc.).

 **IO-Link ® is registered trade mark. The use is restricted for members of the IO-Link Community. More detailed terms for the use can be found in the IO-Link Community Rules on www.io-link.com.**

Conventions:

In this specification the following key words (in **bold** text) will be used:

may:	indicates flexibility of choice with no implied preference.
should:	indicates flexibility of choice with a strongly preferred implementation.
shall:	indicates a mandatory requirement. Designers shall implement such mandatory requirements to ensure interoperability and to claim conformity with this specification.
highly recommended:	indicates that a feature shall be implemented except for well-founded cases. Vendor shall document the deviation within the user manual and within the manufacturer declaration.

249

250 1 Introduction

251 An IODE (IO Device Description) is a set of files that formally describes a device e.g. IO-Link
252 Device.

253 The IODE is created by the device vendor and shall be sufficient for IO-Link Tools to identify,
254 communicate, parameterize and diagnose the device.

255 The set of files consists of the main IODE file, optional language files and optional picture files.

256 An IODE is mandatory for each IO-Link Device. This specification defines the IODE for IO-Link
257 Devices that conform to the IO-Link Interface and System Specification Version 1.1.3.

350	XSLT	XSL Transform (see REC-xslt-19991116)

351 **4 Basic structure**

352 The following figure shows the basic structure of the main IODE file. It follows the ISO 15745-1:2003 standard regarding the device profile and communication network profile. It consists of the elements DocumentInfo, ProfileHeader, ProfileBody, CommNetworkProfile, ExternalTextCollection and the Stamp.

356

357 **Figure 1 – Structure of main IODE file following ISO 15745-1**

358 5 Files

359 Conceptionally, the IO Device Description consists of the set of files created by the device
360 vendor, and the set of standard definition files which are part of this specification. IO-Link Tools
361 combine information from both sets of files to get the complete device description.

362 All IODE XML files shall use "UTF-8" for the encoding. They shall use the namespace
363 <http://www.w3.org/2001/XMLSchema-instance> with the prefix "xsi" and the namespace
364 <http://www.io-link.com/IODE/2010/10> with the prefix "iod". A schemaLocation for the
365 namespace <http://www.io-link.com/IODE/2010/10> to the required schema shall be given. For
366 the main IODE file, this is IODE1.1.xsd, and for the language files this is IODE-
367 Primitives1.1.xsd. The schema file name shall be given without any path prefix. No other
368 namespaces shall be described. IODE XML files shall not use any DTD (Document Type
369 Definition, see <http://www.w3.org/TR/xml/#sec-prolog-dtd>).

370 All XMLs generated by the vendor shall be checked by the IODE Checker software before
371 delivery. This Checker is a tool available from the IO-Link web site (<http://www.io-link.com/>). It
372 checks the content of the device description and if no errors were found writes a checksum over
373 the file contents into the element Stamp at the end of the XML-file.

374 IO-Link Tools shall compare the checksum in the Stamp with the checksum calculated from the
375 file contents. It is recommended to reject the IODE if there is a mismatch. Tools may then omit
376 schema validation and additional checks.

377 IO-Link Tools shall use the file name of the IODE only to discover the language files that are
378 associated with the main IODE file. Apart from that, tools shall not evaluate the file name; they
379 always evaluate the file's content. The device-specific file name is only intended for better
380 legibility.

381 Adherence to the rules for file names makes it possible that all IODEs can be stored side-by-
382 side in a single directory.

383 File names shall not only be different in upper and lower case. Case sensitivity of default parts
384 of file names shall be adhered to.

385 The following special characters are permitted in vendor name and device name: _, #, -

386 All files of the set of files belonging to a specific IODE shall have the same <vendor name> part
387 in their file names. The <vendor name> should be the same for all IODEs of the same vendor.
388 It is not required that the <vendor name> in the file name matches exactly the content of the
389 DeviceIdentity/@vendorName attribute or the standard variable V_VendorName in the device.
390 Usually, the latter two also contain the legal form of the company, e.g. "Inc.", "AG", "S.A." but
391 this is not included in the vendor name part of the file name.

392 5.1 Main IODE file

393 The file name shall follow the following rule:

394 <vendor name>-<device name>-<release date>-**IODE**<schema version>.xml

395 **e.g. VendorX-DeviceY-20110603-IODE1.1.xml**

396 Contains information (in XML) about the identification of the device, communication
397 characteristics, parameters, process data and diagnosis data.

398 The IODE shall always entirely contain texts in the PrimaryLanguage (English). The IODE may
399 contain texts in further languages.

400 A style sheet for the vendor-specific description of Devices for a certain browser (optional):

401 **e.g. VendorX-IODE1.1.xsl**

402 The IODE shall not reference such style sheets with a processing instruction (<?xml-
403 stylesheets ... ?>).

404 **5.2 Language files (optional)**

405 To add support for additional languages after an IODE has been released, separate language
406 files (in XML) may be created. Their file name shall exactly match the name of the main IODE
407 file, except that there is an additional language designation before the file name extension:

408 <vendor name>-<device name>-<release date>-**IODE**<schema version>-<language>.xml

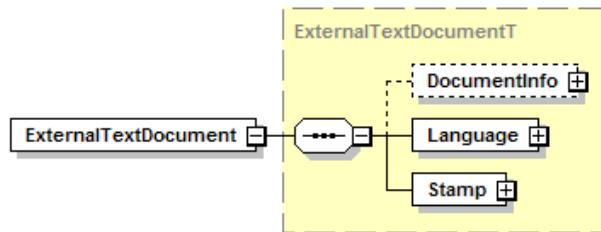

409 The “language” part follows ISO 639-1:2002. The “language” part shall correspond to the
410 value of the ‘xml:lang’ attribute inside the language file. There shall be no additional language
411 file for languages already covered in the main IODE file. The “language” part consists of two
412 letters.

413 The ‘Text’ and ‘TextRedefine’ elements contained in the additional language file shall follow
414 the same rules as specified for the respective elements in additional languages inside the
415 main IODE.

416 **e.g. VendorX-DeviceY-20110603-IODE1.1-ru.xml**

417 Additional language file containing texts in Russian.

418 An IO-Link Tool shall select the appropriate language from the main IODE file or the
419 accompanying language files according to its user interface language settings. A tool shall
420 ignore files whose filename does not match to the naming convention of additional IODE files.

421

Figure 2 – Structure of language file

423 **5.3 Image files (optional)**

424 The file format shall be PNG (file extension .png, see RFC 2083 or ISO/IEC 15948:2004). The
425 same rules for permitted characters apply as in section ‘Files’ (see above).

426 <vendor name>-**logo.png**

427 Vendor logo. 160 x 90 pixel, landscape format. The background of the logo should be
428 transparent.

429 <vendor name>-<picture name>-**icon.png**

430 Device variant icon. 48 x 48 pixel.

431 <vendor name>-<picture name>-**pic.png**

432 Device variant picture. Min. 160 x 160 pixel, max. 320 x 320, square.

433 <vendor name>-<picture name>-**con-pic.png**

434 Device variant connection picture. Min. 160 x 160 pixel, max. 320 x 320, square.

435 The device variant icons and device variant pictures are referenced from the DeviceIdentity/
436 DeviceVariantCollection/DeviceVariant elements. The device variant connection pictures are
437 referenced from the CommNetworkProfile/TransportLayers/PhysicalLayer/Connection

438 elements. The referenced image files shall accompany the main IODE file for stamping and
439 delivery.

440 **5.4 Standard definitions files**

441 **IODE-StandardDefinitions1.1.xml**

442 This file contains the definition of standardized variables, error types and events (see IO-Link
443 Interface and System Specification Version 1.1.3) plus English language texts.

444 **IODE-StandardDefinitions1.1-de.xml, *-es.xml, *-fr.xml, *-it.xml, *-ja.xml, *-ko.xml, *-
445 pt.xml, *-ru.xml, *-zh.xml.**

446 Additional language file containing texts in German, Spanish, French, Italian, Japanese,
447 Korean, Portuguese, Russian, Chinese.

448 **IODE-StandardUnitDefinitions1.1.xml**

449 This file contains the definitions of all available unit codes plus English language texts.

450 Those files are part of the standard and shall not be changed. Vendors of IO-Link Tools should
451 use those files instead of hard-coding standardized things.

452 Additional language files for standard definitions files will be provided by the IODE subteam
453 when needed on the IO-Link website.

454 **5.5 Schema files**

455 Schema files are needed to validate the structure of XML-files and to aid in editing.

456 **IODE1.1.xsd**

457 IODE-schema; includes the following sub-schemas:

458 **IODE-Primitives1.1.xsd**

459 includes basic schema elements

460 **IODE-Datatypes1.1.xsd**

461 includes schema elements for the definition of data types

462 **IODE-Events1.1.xsd**

463 includes schema elements for the definition of error types and events

464 **IODE-Variables1.1.xsd**

465 includes schema elements for the definition of variables

466 **IODE-UserInterface1.1.xsd**

467 includes schema elements for the definition of the user interface

468 **IODE-Communication1.1.xsd**

469 includes schema elements for the definition of the communication network profile

470 **IODE-StandardDefinitions1.1.xsd**

471 schema for the definition of system-specific elements used to validate the file IODE-
472 StandardDefinitions1.1.xml and IODE-StandardUnitDefinitions1.1.xml

473 **IODE-WirelessCommunication1.1.xsd**

474 includes schema elements for the definition of the wireless communication network profile

475 **6 Description mechanisms**

476 **6.1 Names of elements and attributes**

477 Following one common pattern, the names of the elements begin with an uppercase letter while
478 the names of the attributes begin with a lowercase letter. When names consist of several words,
479 each word (except for the first in case of an attribute) starts with an uppercase letter. No
480 separator character (like _) is used.

481 6.2 Ids

482 The values of the attribute 'id' shall follow the regular expression pattern:

483 "[A-Za-z][A-Za-z0-9 _-]*[A-Za-z0-9]".

484 Ids shall be unique within the elements of the same type. The prefix "STD_" is reserved for ids
485 in the standard definition files and shall not be used for elements in the main IODE.

486 6.3 Referencing

487 Each element that can be referenced within the IODE contains an explicit attribute 'id'. The
488 referencing element contains a type-dependent attribute with the following composition:
489 <type>Id

490 Examples: textId, datatypeId, menuId, variableId

491 6.4 Text localization

492 All text components of the different languages which are referenced in the IODE are allocated
493 in the ExternalTextCollection (for further information see "Language-Dependent Description
494 Texts").

495 The text components of the different languages are referenced in the relevant location
496 according to a key (textId).

497 Further languages can be added in an appropriate file (see chapter 5.2).

498 The PrimaryLanguage in the IODE shall be completely available. If there is a further language
499 added in the IODE or in a separate language file, not all entries shall be given. In this case, the
500 interpreter has to go back to the entry of the PrimaryLanguage.

501 7 Device Description

502 For IO-Link Engineering Tools no conformance classes are specified. IO-Link
503 EngineeringTools shall support the IO-Link Interface and System Specification Version 1.1.3
504 completely. For interpretation of the IO Device Description Specification 1.1.3 the following
505 requirements shall be fulfilled.

506 An IO-Link Engineering Tool shall support:

- 507 • All IO-Link devices
- 508 • If the tool provides a catalog, at least one catalog entry for each IODE (derived from
509 DeviceName)
- 510 • All data types
- 511 • All Variables incl. StandardVariables
- 512 • Menus, including Buttons
- 513 • ErrorTypes incl. StandardErrorTypes
- 514 • Conditions
- 515 • User Role "Specialist"
- 516 • Texts in the PrimaryLanguage (English)
- 517 • Refresh of dynamic variable values (on demand or cyclic)
- 518 • When variables marked with attribute modifiesOtherVariables set to "true" are
519 changed, the tool shall either notify the user that other variables are possibly changed,
520 or the tool shall automatically reload.
- 521 • When parameters are up- or downloaded, any ErrorTypes that occur shall be
522 displayed in a way that the user is able to associate them with the parameter that

523 triggered it, either by displaying it at the parameter or by telling the parameter name in
524 the error log.

- 525 • the complete list of error types contained in the standard definition file.
- 526 • the complete list of event codes contained in the standard definition file.
- 527 • Variables with accessRights = "wo" shall never be part of any download sequence
- 528 • Variables with accessRights = "wo" shall always be handled as a single write request
- 529 • The Button assigned text referenced in IODE /Button/Description element to variable
530 StdVariableRef[@id='V_SystemCommand']/StdSingleValueRef shall be shown in a
531 message box with OK and Cancel, see chapter 7.5.8.4 Description
- 532 • if the Button references a SystemCommand or another write-only variable which is
533 defined as SingleValue, tools ought to apply ActionStartedMessage, see chapter
534 7.5.8.4 ActionStartedMessage

535

536 An IO-Link Tool should support, but is not obliged to:

- 537 • Separate catalog entries for each DeviceVariant
- 538 • A separate display of the Process Data (in addition to V_ProcessDataIn /
539 V_ProcessDataOut)
- 540 • Display of the Connection Description
- 541 • Texts in other Languages than the PrimaryLanguage
- 542 • User Roles other than "Specialist"
- 543 • Vendor logo, pictures and icons.
- 544 • For menu entries having gradient and/or offset: additional display of the raw value
- 545 • Names of ValueRanges
- 546 • Events incl. StandardEvents
- 547 • ErrorTypes and Events: additional display of the raw values

548

549 IO-Link Tools distinguish devices by their VendorID and DeviceID, and the IODDs of a device
550 by the IODE version they are based on and their DocumentInfo/@releaseDate. Tools shall
551 prefer V1.0.1 IODDs over V1.0 IODDs, and within the IODE version newer IODDs over older
552 IODDs. For V1.1 IO-Link devices there shall be only a single current (most recent) IODE
553 based on V1.1, and if the device is compatible to IO-Link V1.0, additionally a single current
554 IODE based on V1.0.1 or V1.0.

555 7.1 Notation of XML structure

556 The XML structure is hierarchical. As the whole structure is too complex to show in one figure,
557 the description is split into a series of figures, starting with the root element and descending
558 into the details.

559 Following each figure showing the structure of a particular section of the IODE, all the
560 elements and their attributes are listed in the order in which they appear inside the figure.

561 The description of elements and attributes follows this pattern:

562 **Element_or_attribute_name (Use[, XML_type])**
563 Semantics of the element or attribute. If the element or attribute has a value, a
564 possible default or fixed value is also described here.

565 **Element_or_attribute_name** is the name of the element or attribute. Remember that element
566 names start with an uppercase letter while attribute names start with a lowercase letter.

567 **Use** is one of the following letters:
568 m Mandatory
569 o Optional
570 c Conditional (depends on, see description):
571 Schema is not powerful enough to formulate the complex IODD rules, therefore
572 business logic has to be checked by IODD Checker, see Annex C

573 **XML_type** is the XML schema data type of the element or attribute value (if applicable). Do
574 not confuse this with the data types that the device's variables and process data may use.
575 **XML_type** may be

- 576 • one of the basic XML types defined in REC-xmlschema-2-20041028. The namespace
577 prefix “xsd:” is omitted for brevity.

578 • one of the IODD XML types defined in IODD-Primitives1.1.xsd (see Table 1).

Table 1 – IODD XML types

XML_type	Defined as	Use
IdT	xsd:string with pattern: "[A-Za-z][A-Za-z0-9_-]*[A-Za-z0-9]"	Used for an 'id' attribute at an element so it can be referenced.
RefT	xsd:string with pattern: "[A-Za-z][A-Za-z0-9_-]*[A-Za-z0-9]" (same as IdT)	Used as a reference to some element that has an 'id' attribute.
SubindexT	xsd:unsignedByte restricted to 1..255 (0x01..0xFF)	For sub-adressing within an index.
BitCountT	xsd:unsignedShort	For bit offsets and bit lengths.
IsduLengthT	xsd:unsignedByte restricted to 1..232	For lengths (in octets) which shall fit into an ISDU
DeviceIdT	xsd:unsignedInt restricted to 1..16777215 (0x000001..0xFFFFF)	For a device ID.
CharacterEncodingT	xsd:string, either "UTF-8" or "US-ASCII"	The character encoding of a string.
VersionT	xsd:string with pattern: "\d+(\.\d+){1,7}"	To express a version of e.g. the IO-Link specification, the IODD Checker, the IODD instance.
AccessRightsT	xsd:string, either "ro", "rw" or "wo"	Access rights read only, read-write or write-only.

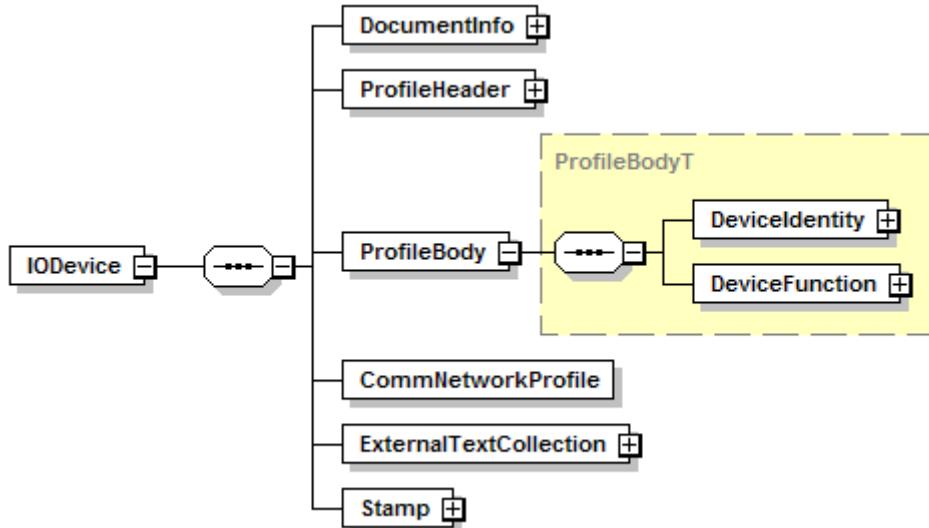

580

581 Further restrictions to these XML types are mentioned directly at the XML type or in the
582 element / attribute description.

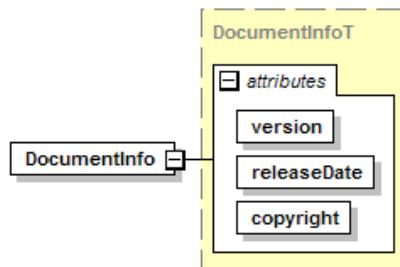

583

584 **7.2 Basic structure of the main IODD file**

585 Figure 3 shows the basic structure of a device in a device description.

586

Figure 3 – Basic structure of main IODD file588 **7.3 Metainformation**589 **7.3.1 DocumentInfo (m; o for language file)**

590

Figure 4 – DocumentInfo element

592 Here the vendor inserts the information for the IODD.

593 **version (m, VersionT)**

594 The ‘version’ attribute contains the version of the concrete instance and not the version of the
 595 IODD specification. The vendor shall increase this version for each official release of the IODD
 596 for a particular device.

597 **releaseDate (m, date with pattern "\d{4}-\d{2}-\d{2}")**

598 The date information in the IODD file name shall correspond to the ‘releaseDate’ attribute in
 599 the DocumentInfo element. The releaseDate attribute of a language file shall correspond to the
 600 releaseDate attribute of the main IODD. There shall be no more than one official release of the
 601 IODD for a particular device per day. IO-Link Tools shall rely on this date for determining the
 602 newest version of the IODD for a device.

603 **copyright (m, string)**

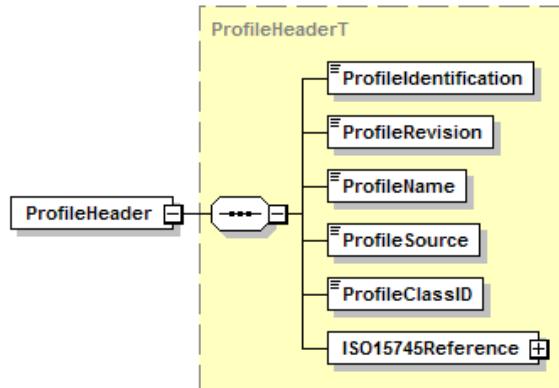

604 Vendor-specific copyright text.

605 e.g.

606 File name: IO-Link-SampleDevice-20200801-IODD1.1.xml

607 DocumentInfo:
 608 <DocumentInfo version="V5.17" releaseDate="2020-08-01" copyright="IO-Link Community"/>

609 **7.3.2 ProfileHeader (m)**

610
 611 **Figure 5 – ProfileHeader element**

612 Within this element, the vendor shall give the following constant information in plain text.

613 **ProfileIdentification (m, string)**

614 Fixed to "IO Device Profile"

615 **ProfileRevision (m, string)**

616 Fixed to "1.1".

617 **ProfileName (m, string)**

618 Fixed to "Device Profile for IO Devices".

619 **ProfileSource (m, string)**

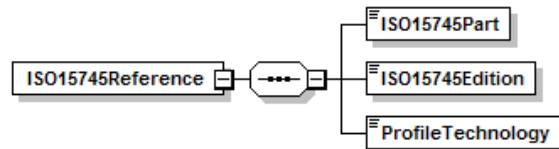

620 Fixed to "IO-Link Consortium"

621 **ProfileClassID (m, NMOKEN)**

622 Fixed to "Device".

623 **ISO15745Reference (m)**

624 Information about the underlying ISO standard

625
 626 **Figure 6 – ISO15745Reference element**

627 **ISO15745Part (m, positiveInteger)**

628 Fixed to "1".

629 **ISO15745Edition (m, positiveInteger)**

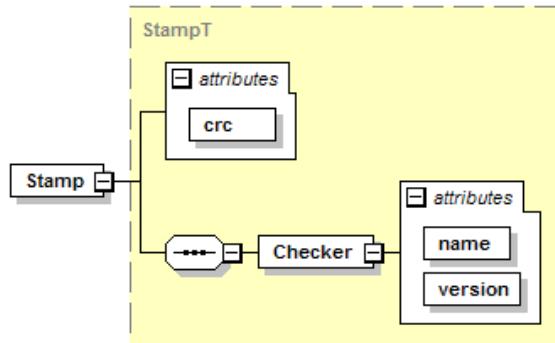

630 Fixed to "1".

631 **ProfileTechnology (m, string)**

632 Fixed to "IODE".

633 **7.3.3 ProfileBody (m)**

634 The ProfileBody contains the description of identity and functionality of the device.

635 **7.3.4 File validation**

636

Figure 7 – Stamp element

638 There is a tool called “IODED Checker” that intensely tests the IODED if it is conformant to this
 639 specification. The Checker features a *check* and a *stamp* mode. In *check* mode, errors detected
 640 during the checking process are reported, but the file remains unchanged. In *stamp* mode, the
 641 Stamp element is always rewritten.

642 **crc (m, unsignedInt)**

643 If no errors are detected during the checking process, the ‘crc’ attribute is set to the CRC value
 644 calculated from the file contents. Otherwise, the ‘crc’ attribute is set to an invalid value. By
 645 checking the CRC, an IO-Link Tool can find out whether the IODED has been altered since the
 646 last successful check. In this case, the IODED should be rejected by the tool.

647 For the CRC, the CRC-32 algorithm is used (see section 8.1.1.6.2 of ITU-T recommendation
 648 V.42 (03/2002) or ISO/IEC 13239:2002). Before the actual calculation, the ‘crc’ attribute is set
 649 to an empty string and the checker inserts its name and version into the appropriate attributes.
 650 The generated CRC is then inserted into the ‘crc’ attribute.

651 The CRC calculation is done as follows: The IODED file is read in binary mode. The stream of
 652 bytes is fed into the CRC algorithm until the string <Stamp crc=“ has been processed. The
 653 value of the attribute crc is skipped, and the CRC calculation continues with the closing
 654 quotation mark.

655 The same is done with external language documents, but after the end-of-file has been reached,
 656 the CRC of the main IODED file is converted to decimal representation (no leading zeroes) and
 657 the character codes for the digits are fed into the CRC algorithm.

658 **Checker (m)**

659 Identification of the IODED Checker version used to check and stamp this file. If there is a severe
 660 bug in a specific Checker version, or the method of calculating the CRC shall be modified in the
 661 future, IO-Link Tools are able to adapt to this based on the Checker name and version.

662 **name (m, string)**

663 The name of the IODED Checker.

664 **version (m, VersionT)**

665 The version of the IODED Checker.

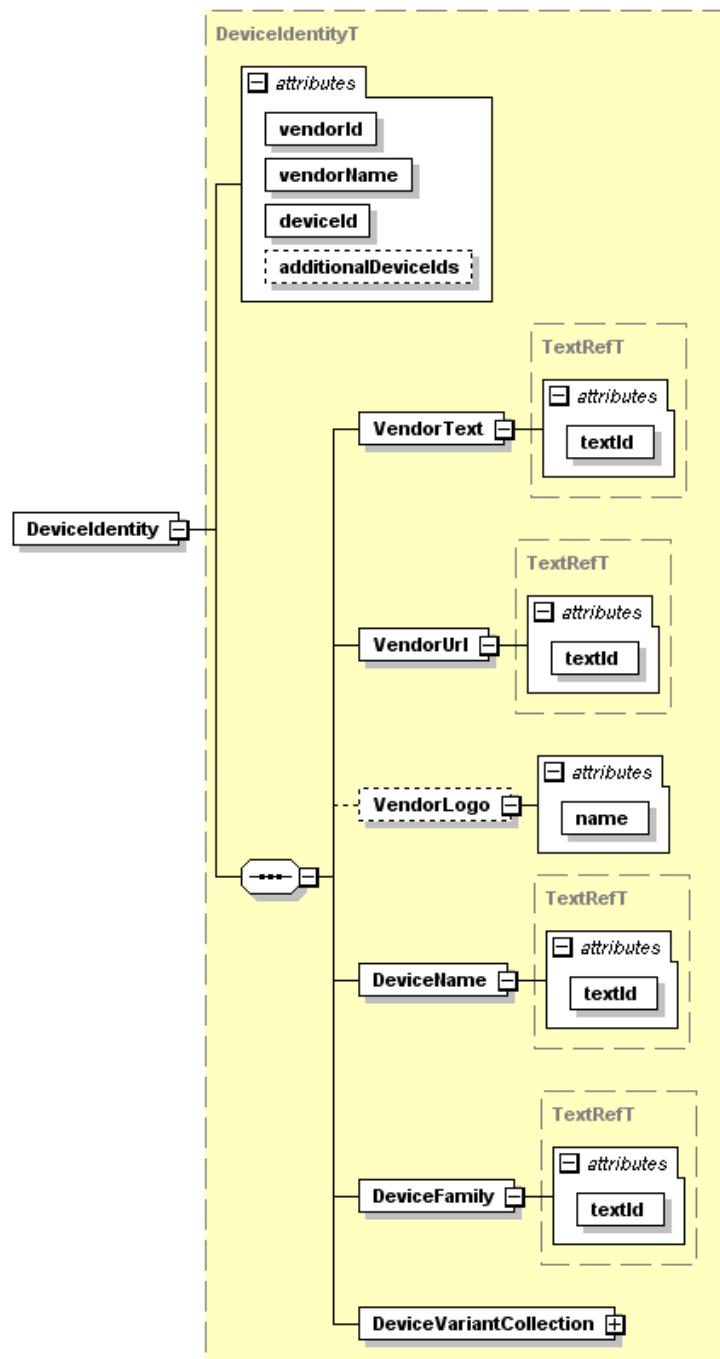

666 When writing a new IODED, before applying the IODED checker on it for the first time, it is
 667 recommended to set the attributes to the following values:

668 Stamp/@crc = "0"
 669 Stamp/Checker/@name = "" (empty string)
 670 Stamp/Checker/@version = "V0.0.0.0"

671 It is highly recommended, not to insert comments in or after the Stamp element.

672 **7.4 Device identity**

673 On import of a new IODE, IO-Link Tools shall use the pair vendorId and deviceid to decide
 674 whether this IODE describes a new device (catalog entries shall be added) or this IODE is a new
 675 description of an already known device (catalog entries shall be updated). This decision shall
 676 not be based on the filename of the IODE.

677

Figure 8 – Devicelidentity element

679 **vendorId (m, unsignedShort)**

680 Unique identification of the vendor, assigned by the IO-Link Community. An IO-Link Tool shall
 681 display this id in decimal notation. The vendorId shall match the content of
 682 V_DirectParameters_1, subindex 8-9. The allowed value range is 1..65535 (0x0001..0xFFFF).

683 **vendorName (m, string)**

684 Name of the vendor of the device.

685 deviceld (m, DeviceldT)

686 Vendor-internal unique identification of the device; an IO-Link Tool shall display this id in
687 decimal notation. The deviceld shall match the content of V_DirectParameters_1, subindex 10-
688 12.

689 additionalDeviceIds (o, list of DeviceldT with min. one and max. 255 entries)

690 A list of device IDs which are supported by this device. In other words, this device may replace
691 devices of the same vendor whose device IDs are listed in this attribute.

692 VendorText (m)**693 textId (m, RefT)**

694 A text describing the vendor (a slogan).

695 VendorUrl (m)**696 textId (m, RefT)**

697 The vendor's URL.

698 VendorLogo (o)**699 name (m, string with pattern "([\\p{L}\\d_#]+-)+logo\\.png")**

700 File name of the vendor's logo; in PNG format, 160 x 90 pixels. If the element 'VendorLogo' is
701 used, the image file referenced by the attribute 'name' shall be present.

702 DeviceName (m)**703 textId (m, RefT)**

704 Common name for all variants. IO-Link Tools may use this to group the device variants of a
705 device in the device catalog.

706 DeviceFamily (m)**707 textId (m, RefT)**

708 Vendor-specific classification of the devices. IO-Link Tools may use this for grouping devices
709 in the device catalog.

710 7.4.1 Device variant collection

711 Using the Vendor ID and Device ID read out from an unknown IO-Link Device, it shall be
712 possible to uniquely find the latest version of the appropriate IODD. All variants referenced in
713 the Device variant collection share the same data model and menu representation. They may
714 differ only in the elements Variant and Connection. Thus is it not allowed that IO-Link Devices
715 that differ in details described in ProfileBody/DeviceFunction or CommNetworkProfile except
716 for element Connection share the same combination of Vendor ID and Device ID.

717

718 The things in which the devices may differ are those that are not "seen" by the IO-Link Tool,
719 like:

- 720 • type of plug and length of cable
- 721 • materials: plastics, stainless steel
- 722 • shape: round, ..
- 723 • fastening: through-hole, bracket
- 724 • allowed environmental conditions: temperature range, humidity, shock resistance
- 725 • certificates: CE, UL

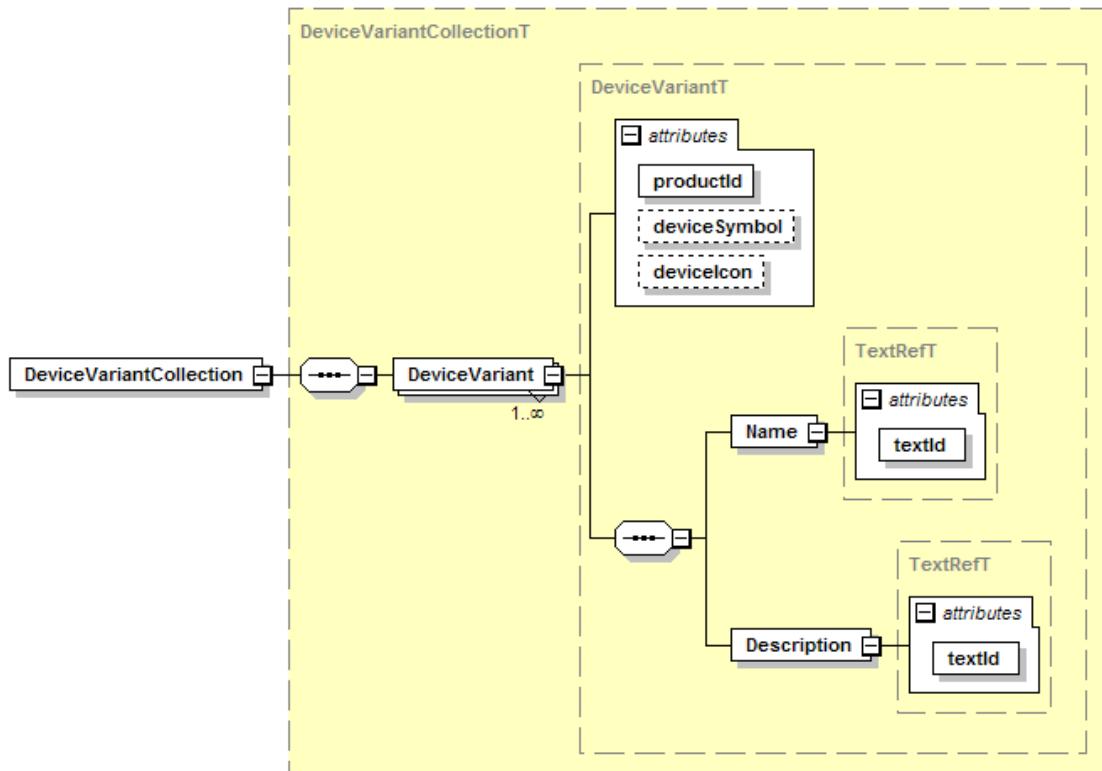

726 Devices that only differ in these things may use the same Vendor ID and Device ID and shall
727 be described as different Device Variants in a single IODD. If the device supports ISDU Index
728 19 (V_ProductID), the value read from this ISDU shall match exactly to the 'productId' attribute
729 of exactly one DeviceVariant.

730 Examples for things in which devices may **not** differ:

- 731 • measurement ranges (with sensors)

732 • power range (with actuators)

733 There shall be at least one device variant.

734

Figure 9 – DeviceVariantCollection element

736 **productId (m, string)**

737 Uniquely identifies the product within the DeviceVariants. 'productId' in IODD corresponds to
738 the ISDU standard parameter V_ProductID. If V_ProductID is not implemented in the device
739 only one single device variant shall be referenced in the IODD.

740 **deviceSymbol (o, string with pattern "([\\p{L}\\d_#]+-)+pic\\.png")**

741 File name of the device symbol. If this attribute is used, the referenced image file shall be
742 present.

743 **deviceIcon (o, string with pattern "([\\p{L}\\d_#]+-)+icon\\.png")**

744 File name of the device icon. If this attribute is used, the referenced image file shall be present.

745 **Name (m)**

746 **textId (m, RefT)**

747 Used to build the catalog entries for the device variants in the IO-Link Tool. Shall be unique for
748 each DeviceVariant within each supported language.

749 It shall correspond to the product name in the vendor's catalogue or to the name which is
750 labelled on the product.

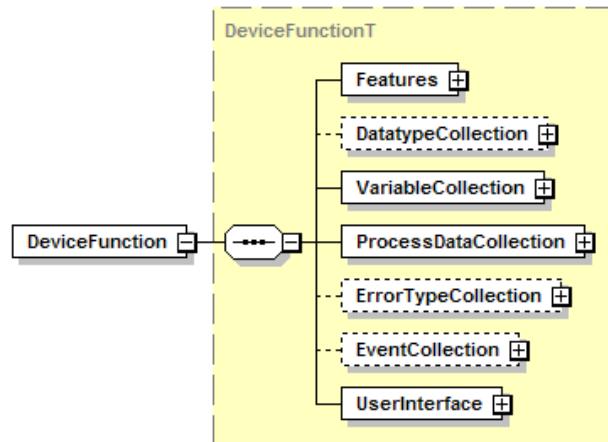

751 **Description (m)**

752 **textId (m, RefT)**

753 Descriptive text of the device.

754 **7.5 Device function**

755 The entire functionality of the device is collected here. Parameters, process data, data types,
756 error codes and events are defined. Their significances, addresses, and data fields are
757 identified as well as a grouping of the views in menus is defined.

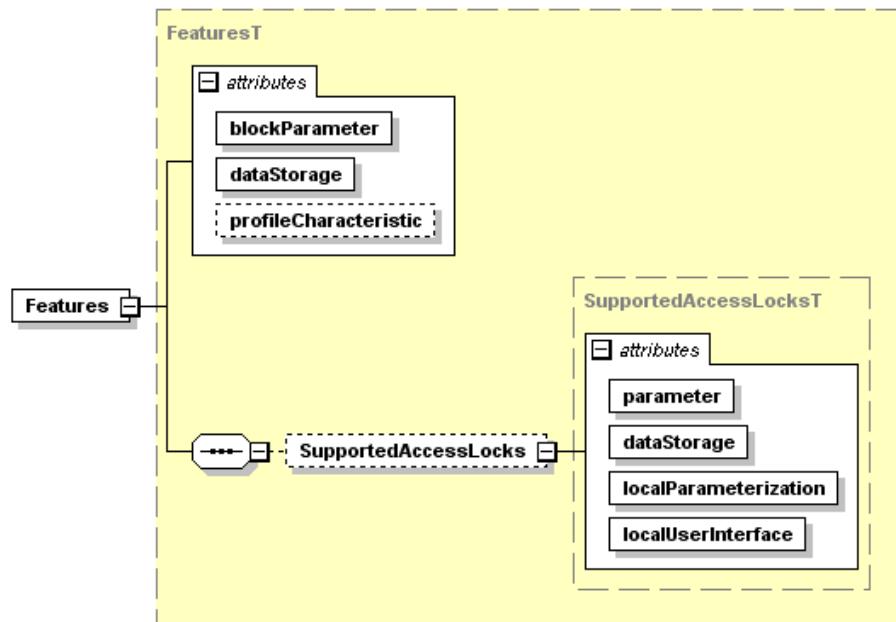

758

759

Figure 10 – DeviceFunction element760 **7.5.1 Features**

761 Supported standardized features of the device are described.

762

763

Figure 11 – Features element764 **blockParameter (m, boolean)**

This attribute defines if a device supports the functionality of Block Parameter transmission.
See IO-Link Interface and System Specification Version 1.1.3, chapter 10.3.5.

767 IO-Link Tools shall use Block Parameter transmission if the device supports it and if more than
768 one variable is to be transferred due to a single user action.

769 Typical Block Parameter sequences:

770 [Upload](#)

- 771 • Send SystemCommand ParamUploadStart
- 772 • Upload all variables of the current user role
- 773 • Send SystemCommand ParamUploadEnd

774

775 [Download](#)

776 • Send SystemCommand ParamDownloadStart
 777 • Download the changed (or all) variables of the current user role
 778 • Send SystemCommand ParamDownloadEnd or ParamDownloadStore

779

780 **dataStorage (m, boolean)**
 781 This attribute defines if a device supports data storage functionality.

782 If any standard ISDU variable with accessRights = "rw" is present, this attribute shall not be set to "false".

784 If any device specific ISDU variable with accessRights = "rw" is present, it is highly recommended that this attribute is not set to "false".

786 **profileCharacteristic (o, list of unsignedShort with min. one and max. 32 entries)**
 787 A list of Profile Identifiers (PID) which are supported by this device. This list describes the supported profiles and function classes. This attribute shall be given if any IO-Link Profile is supported.

790 Example: profileCharacteristic="10 49 16384"

791

792 **SupportedAccessLocks (c)**
 793 Shall be present if the standard variable V_DeviceAccessLocks is supported.

794 **parameter (m, boolean)**
 795 Whether parameter access lock is supported. The assigned variable V_DeviceAccessLocks.ParameterAccessLock shall not be referenced in IODD menu.

797 According IO-Link Interface and System Specification Version 1.1.3, it is highly recommended, that parameter lock functionality shall not be implemented.

799 **dataStorage (m, boolean)**
 800 Whether data storage access lock is supported. The assigned variable V_DeviceAccessLocks.DataStorageLock shall not be referenced in IODD menu.

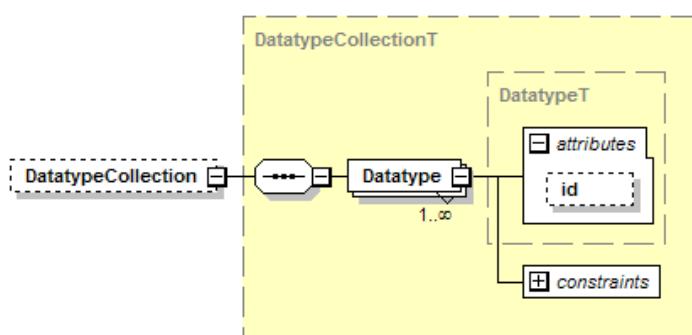

802 According IO-Link Interface and System Specification Version 1.1.3, it is highly recommended, that dataStorage lock functionality shall not be implemented.

804 **localParameterization (m, boolean)**
 805 Whether local parameterization access lock is supported.

806 **localUserInterface (m, boolean)**
 807 Whether local user interface access lock is supported.

808 **7.5.2 Data type collection**

809 The DatatypeCollection incorporates all declarations for the reuse of data types (especially useful for records). There shall be no unreferenced Datatype elements. Standardized data types are described in the schema IODD-Datatypes1.1.xsd.

812
 813

Figure 12 – DatatypeCollection element

814 For the Datatype element, this figure only shows the elements and attributes common to all
 815 data types. The actual selected data type needs additional elements and attributes. See chapter
 816 15 for details.

817 **id (c, IdT)**

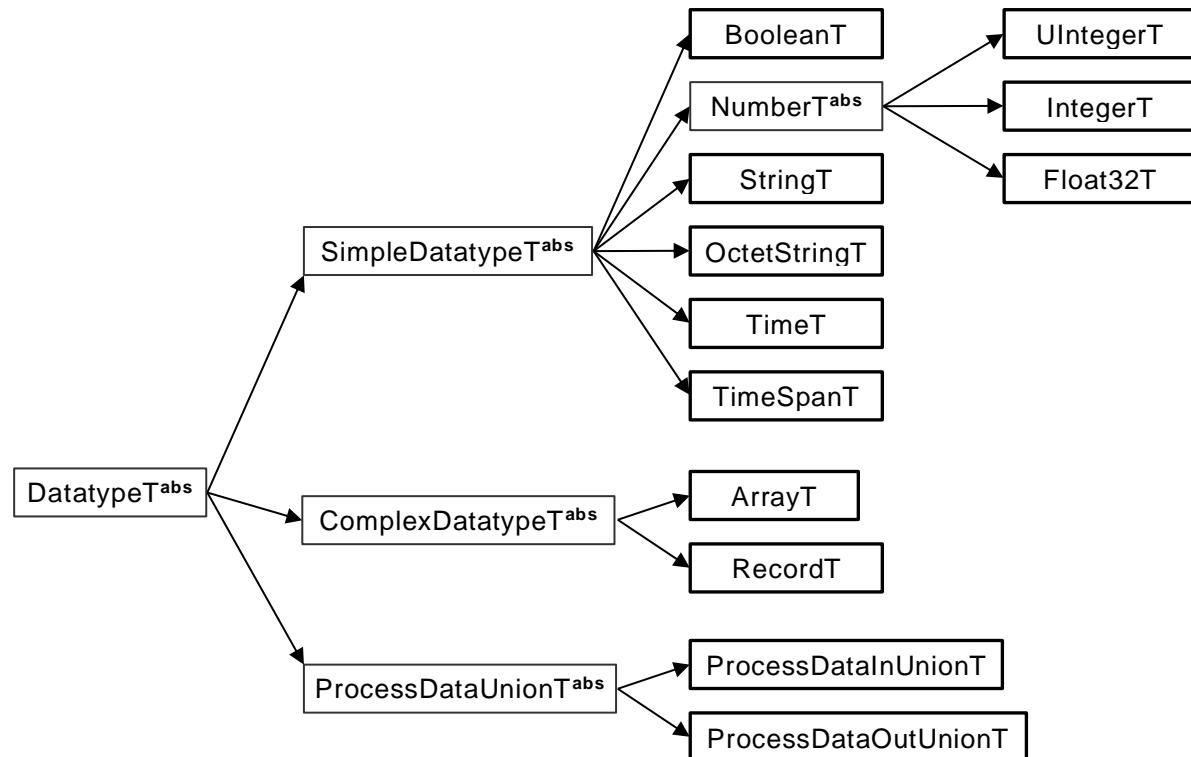

818 Datatype elements within the DatatypeCollection shall have an attribute 'id'. Datatype elements
 819 outside of the DatatypeCollection shall not have an attribute 'id'.

820 **7.5.3 Data types**

821 The IODD-Datatypes1.1.xsd schema provides derived types for all possible data types. The
 822 presence and type of required elements and attributes is checked by this schema.

823 Actually, the data types form the following hierarchy:

824

825

826

827 **Figure 13 – Data type hierarchy**

828 Each derivation adds elements and/or attributes appropriately.

829 Excursion on XML schema *abstract types*:

830 An abstract type can't be used itself. Only non-abstract types which are derived from an
 831 abstract type can be used. The instance selects the desired derived type with *xsi:type="name
 832 of the derived type"*.

833 This technique is used here with the 'Datatype' element to adapt the XML structure to the
 834 requirements of the specific data type.

835 For the serialization of the data types see IO-Link Interface and System Specification Version
 836 1.1.3, Annex F.

837 **7.5.3.1 Simple data types**

838 The coding of simple data types is shown only for singular use which is characterized by

- 839 • Process data consisting of one simple data type

- 840 • Parameter consisting of one simple data type
 841 • Subindex (>0) access on individual data items of parameters of complex data types
 842 (arrays, records)

843 **7.5.3.1.1 General**

844 When the Datatype element appears inside the DatatypeCollection, the attribute 'id' shall be
 845 present. Otherwise, the attribute 'id' shall not be present.

846 SingleValue and ValueRange elements are strongly typed.

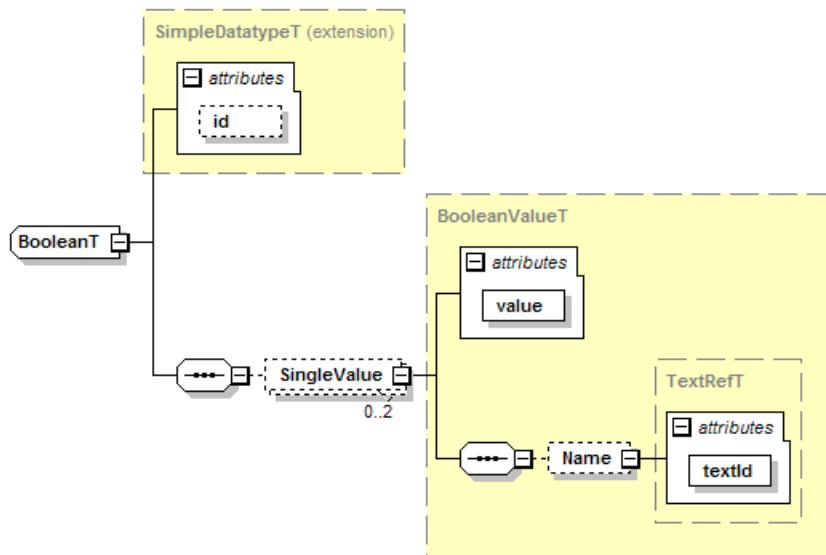

847 Where SingleValue and / or ValueRange elements are permitted, the following rules shall be
 848 considered:

- 849 • When neither SingleValue nor ValueRange elements are given, the complete value
 850 range of the data type is allowed. When SingleValue(s) and / or ValueRange(s) are
 851 given, only these values are allowed.
- 852 • In ValueRanges, both the lowerValue and the upperValue are included in the range of
 853 allowed values.
- 854 • In ValueRanges, the lowerValue shall be less than the upperValue (not equal).
- 855 • SingleValues and ValueRanges shall not overlap.

856

857 **7.5.3.1.2 BooleanT**

858 Figure 14 shows the IODE representation of the data type BooleanT.

859

Figure 14 – BooleanT

861 **Lexical representation:**

862 Conforms to the representation of “boolean” in XML Schema, see
 863 <http://www.w3.org/TR/xmlschema-2/#boolean>

864 Regular expression pattern: “true|false|1|0”

865 **Example:**

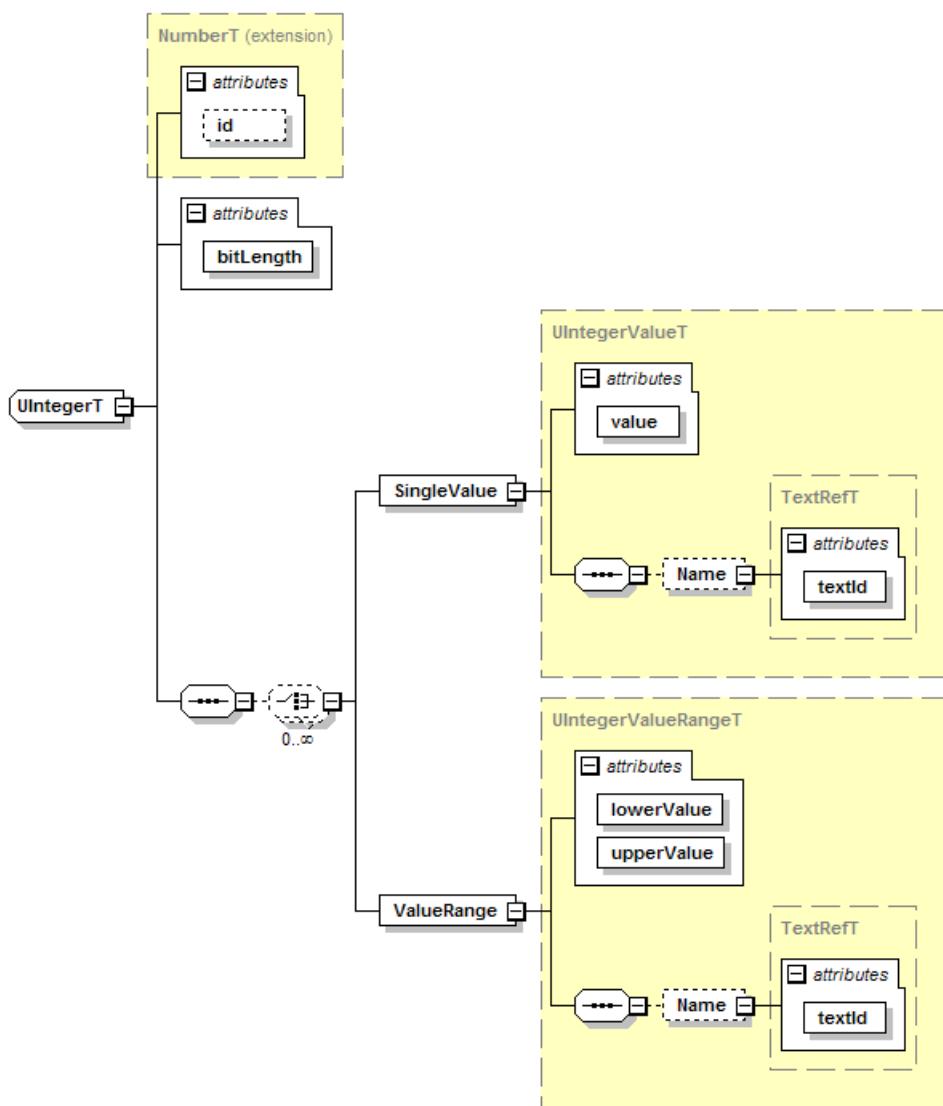

```

867 <Datatype xsi:type="BooleanT">
868   <SingleValue value="false">
869     <Name textId="TN_Inversion_Off"/>
870   </SingleValue>
871   <SingleValue value="true">
872     <Name textId="TN_Inversion_On"/>
  
```

873 </SingleValue>
 874 </Datatype>
 875

876 7.5.3.1.3 UIntegerT

877 Figure 15 shows the IODE representation of the data type UIntegerT.

878

Figure 15 – UIntegerT

880 **bitLength (m, BitCountT)**

881 Specifies the size of the unsigned integer in bits. The allowed value range is 2..64.

882 **Lexical representation:**

883 Conforms to the representation of “unsignedLong” in XML Schema, see
 884 <http://www.w3.org/TR/xmlschema-2/#unsignedLong>

885 Regular expression pattern: “+?\d+”

886 **Example:**

```

887
888 <Datatype xsi:type="UIntegerT" bitLength="8">
889   <SingleValue value="96">
890     <Name textId="TN_System"/>
891   </SingleValue>
892 </Datatype>
```

893

894 **7.5.3.1.4 IntegerT**

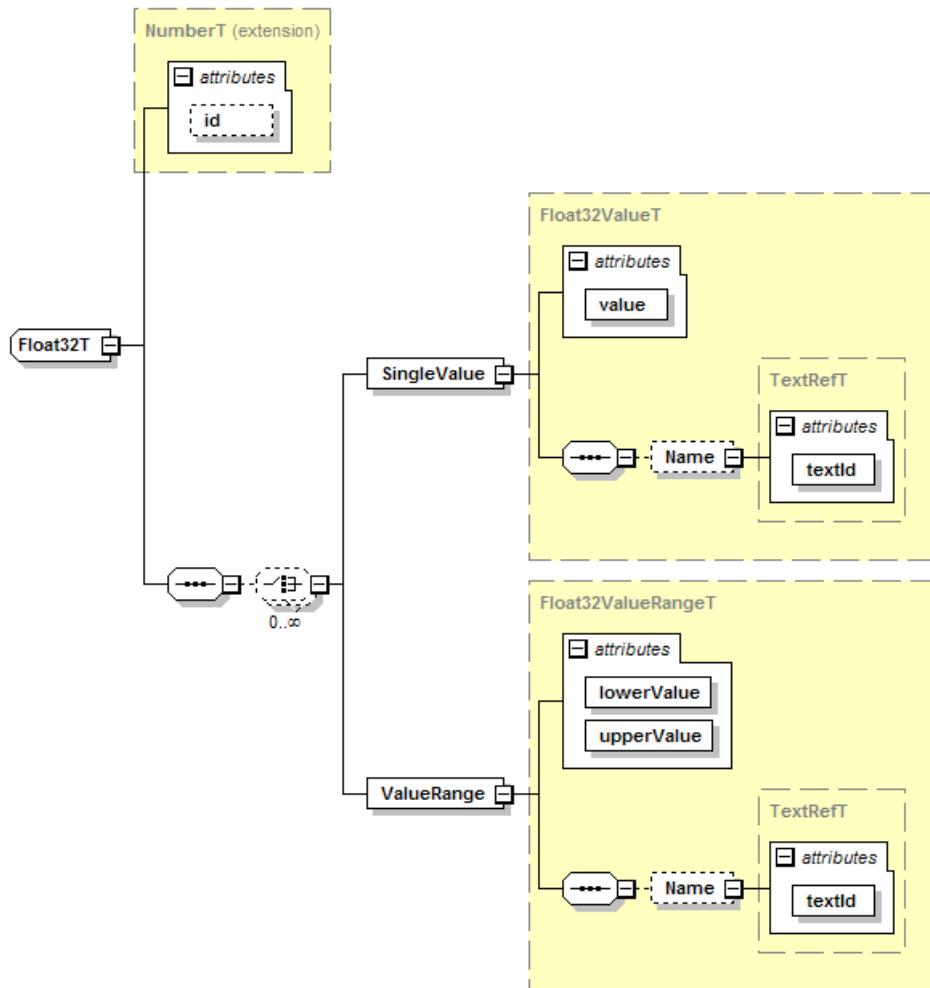

895 For the representation of the data type IntegerT in the IODE and an example see 19.

896 **Lexical representation:**897 Conforms to the representation of “long” in XML Schema, see
898 <http://www.w3.org/TR/xmlschema-2/#long>

899 Regular expression pattern: “[+-]?\d+”

900 **7.5.3.1.5 Float32T**

901 Figure 16 shows the IODE representation of the data type Float32T.

902

903

Figure 16 – Float32T904 **Lexical representation:**905 Conforms to the representation of “float” in XML Schema, see
906 <http://www.w3.org/TR/xmlschema-2/#float>

907 Regular expression pattern: “[+-]?\d+(\.\d+)?([eE][+-]?\d+)?|-?INF”

908 **Example:**

```

910 <Datatype xsi:type="Float32T">
911     <SingleValue value="0.0">
912         <Name textId="TN_Zero"/>
913     </SingleValue>
914     <ValueRange lowerValue="1.0" upperValue="1000.0">
  
```

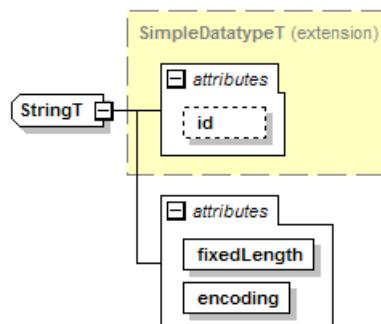

```

915      <Name textId="TN_Valid"/>
916      </SingleValue>
917  </Datatype>
918

```

919 7.5.3.1.6 StringT

920 Figure 17 shows the IODD representation of the data type StringT.

921

Figure 17 – StringT

923 **fixedLength (m, IsduLengthT)**

924 Specifies the length of the string in octets.

925 **encoding (m, CharacterEncodingT)**

926 The character encoding of the string. Note that US-ASCII consists of 7-bit characters only. Note
927 that string constants in UTF-8 may need more than one octet per character.

928 **Lexical representation:**

929 Conforms to the representation of “string” in XML Schema, see

930 <http://www.w3.org/TR/xmlschema-2/#string>

931 Regular expression pattern: “.” (No restriction, just the string.)

932 Special characters shall be coded according to the XML syntax. See REC-xml-20081126,
933 chapter 2.4 Character Data and Markup.

934 & → &

935 ‘ → ' (only required if inside a string enclosed in ‘ characters)

936 > → >

937 < → <

938 “ → " (only required if inside a string enclosed in “ characters)

939 **Example:**

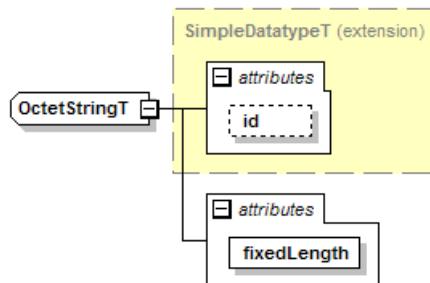

940

941 <Datatype xsi:type="StringT" fixedLength="64" encoding="UTF-8"/>

942

943 7.5.3.1.7 OctetStringT

944 Figure 18 shows the IODD representation of the data type OctetStringT.

945

946 **Figure 18 – OctetStringT**947 **fixedLength (m, lsduLengthT)**

948 Specifies the length of the octet string in octets.

949 **Lexical representation:**

950 Regular expression pattern: "(0x[0-9A-Fa-f][0-9A-Fa-f],)*0x[0-9A-Fa-f][0-9A-Fa-f]"

951 **Example:**

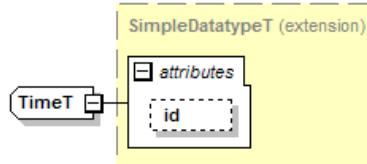

952

<Datatype xsi:type="OctetStringT" fixedLength="10"/>

954

955 **7.5.3.1.8 TimeT**

956 Figure 19 shows the IODD representation of the data type TimeT.

957

958 **Figure 19 – TimeT**959 **Lexical representation:**960 Follows the representation of "dateTime" in XML Schema, see
961 <http://www.w3.org/TR/xmlschema-2/#dateTime>, but is stricter:

962 Regular expression pattern: "\d{4}\-\d{2}\-\d{2}(T\d{2}:\d{2}:\d{2}(\.\d{1,3})?)?"

963 (yyyy-mm-dd[Thh:mm:ss[.fff]] where fff = fraction of a second, up to millisecond)

964 **Example:**

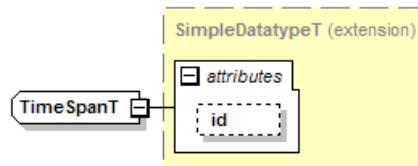

965

<Datatype xsi:type="TimeT"/>

967

968 **7.5.3.1.9 TimeSpanT**

969 Figure 20 shows the IODD representation of the data type TimeSpanT.

970

971 **Figure 20 – TimeSpanT**

972 **Lexical representation:**

973 Follows the representation of “duration” in XML Schema, see
 974 <http://www.w3.org/TR/xmlschema-2/#duration>, but is much stricter:
 975 Regular expression pattern: “[+-]?PT\d+(\.\d{1,3})?S”

976 **Example:**

977
 978 <Datatype xsi:type="TimeSpanT"/>
 979

980 7.5.3.2 Complex data types

981 7.5.3.2.1 General

982 Complex data types are combinations of simple data types. Complex data types consist of
 983 several simple data types in a packed manner within a sequence of octets. Unused bit space
 984 shall be padded with “0”.

985 The coding of simple data types within complex data types shall be the same as for singular
 986 use specified in chapter 16, except for:

987 BooleanT

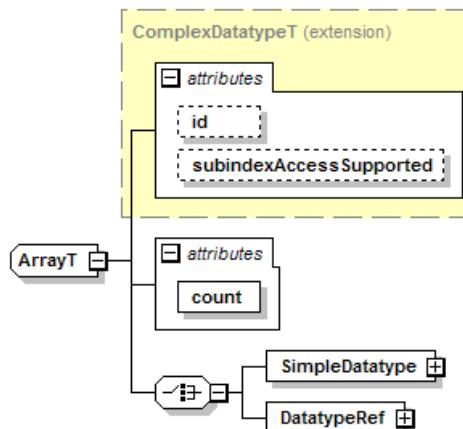

988 The coding of BooleanT is only 1 bit wide. A value of “0” indicates “false” and a value of
 989 “1” indicates “true”. There is no padding to an octet.

990 UIntegerT and IntegerT

991 The coding of UIntegerT and IntegerT is as wide as indicated by the attribute ‘bitLength’.
 992 There is no padding to 1 / 2 / 4 / 8 octets.

993 7.5.3.2.2 Arrays

994 Figure 21 shows the IODE representation of the data type ArrayT.

995

996 **Figure 21 – ArrayT**

997 subindexAccessSupported (o, boolean)

998 If this attribute is present and set to “false”, individual data items of the array cannot be
 999 accessed via their subindex. It is only possible to access the complete array via subindex 0.

1000 count (m, SubindexT)

1001 Specifies the fixed number of data items in the array.

1002 The SimpleDatatype element allows any of the types derived from SimpleDatatypeT. Instead of
 1003 defining the simple data type inside the array definition, it is also possible to reference the
 1004 definition of a simple data type from the DatatypeCollection with DatatypeRef/@datatypeId.

1005 Lexical representation:

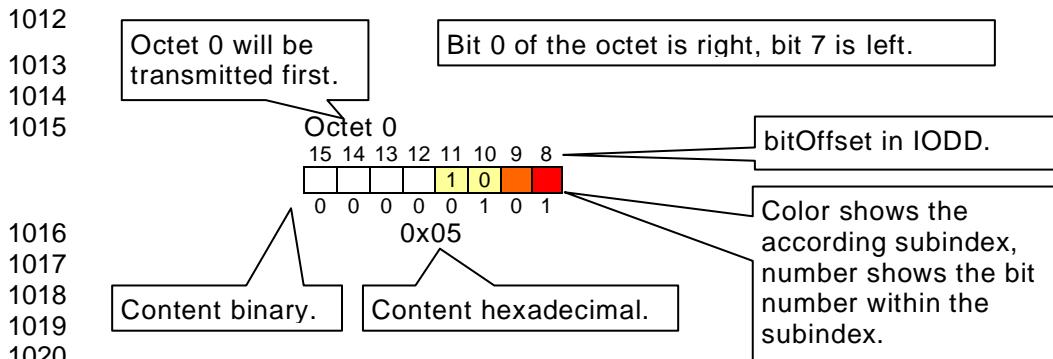

1006 There is no lexical representation for a value of type ArrayT.

1007 Alignment:

1008 Array elements with bitLength < 8 bit shall not cross octet boundaries. For array elements with
1009 bitLength >= 8 bit use bitLength as multiples of 8 bit.

1010 Examples

1011 Notation:

1022 Bit array

```
<Datatype xsi:type="ArrayT" count="3">
    <SimpleDatatype xsi:type="BooleanT"/>
</Datatype>
```

Subindex	Value
1	true
2	false
3	true

1028
1029 Octet 0
7 6 5 4 3 2 1 0
0 0 0 0 0 1 0 1
0x05

1032 Integer array

```
<Datatype xsi:type="ArrayT" count="4">
    <SimpleDatatype xsi:type="IntegerT" bitLength="2"/>
</Datatype>
```

Subindex	Value
1	0
2	-1
3	1
4	1

1038
1039 Octet 0
7 6 5 4 3 2 1 0
1 0 1 0 1 1 0 1
0 0 1 0 0 1 0 1
0x25

1042 Integer array

```
<Datatype xsi:type="ArrayT" count="7">
    <SimpleDatatype xsi:type="IntegerT" bitLength="4"/>
</Datatype>
```

Subindex	Value
1	2
2	-4
3	4
4	-7
5	5
6	-1
7	0

1051

1052 7.5.3.2.3 Records

1053 Figure 22 shows the IODE representation of the data type RecordT.

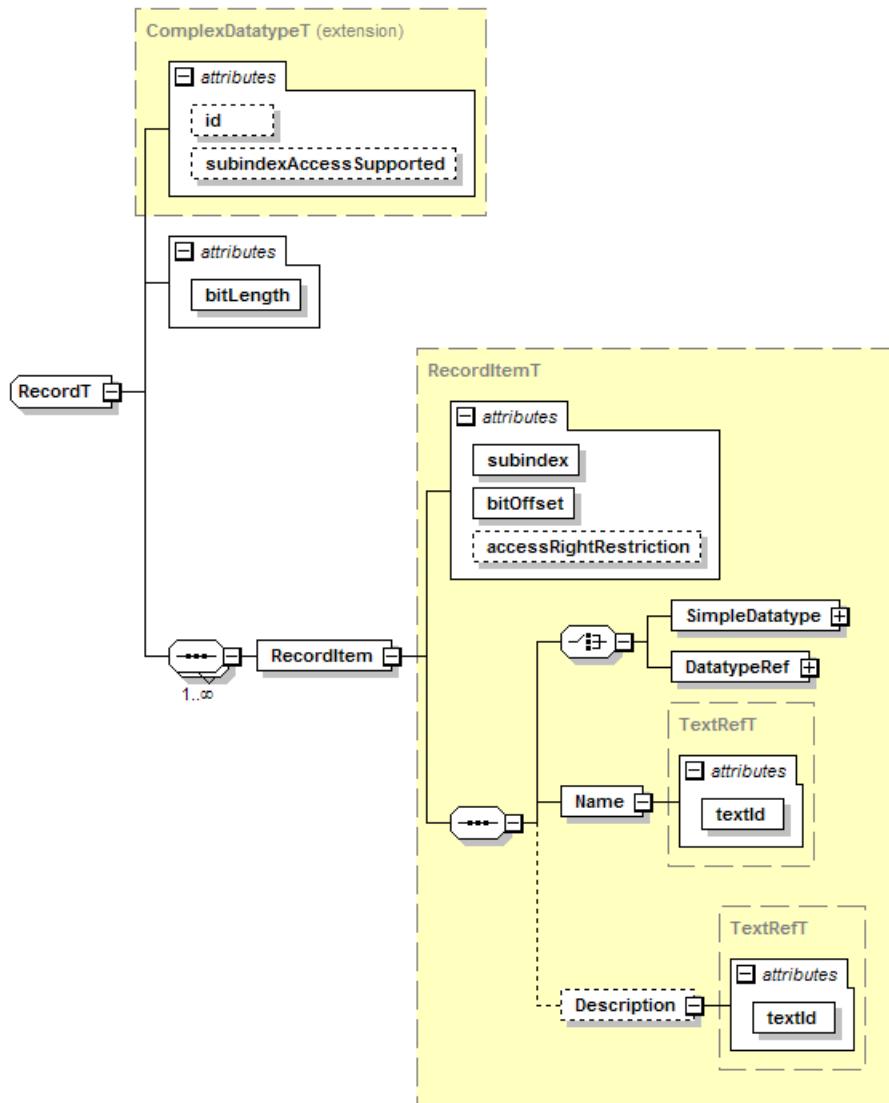

Figure 22 – RecordT

1056 subindexAccessSupported (o, boolean)

1057 If this attribute is present and set to “false”, individual record items cannot be accessed via their
1058 subindex. It is only possible to access the complete record via Subindex 0.

1059 bitLength (m, BitCountT)

1060 Specifies the total length of the record in bits. The allowed value range is 1..1856.

1061 RecordItem (m)

1062 An individual item of a record, addressed by the subindex.

1063 subindex (m, SubindexT)

1064 Specifies the Subindex assigned to this record item. The record items shall be ordered by
1065 Subindex within the record. The subindex shall be unique within the RecordItems of a Record.

1066 It is recommended that the Subindices occur in increasing order within the octet sequence. If
1067 Subindices are placed in previously unused areas of the octet sequence, one might deviate
1068 from this recommendation. If compatible extensions are foreseen, it is better to reserve enough
1069 Subindices for the unused areas.

1070 bitOffset (m, BitCountT)

1071 bit position of the record item within the octet sequence. The record items within a record shall
1072 not overlap. The allowed value range is 0..1855.

1073 accessRightRestriction (o, AccessRightsT)

1074 This attribute is only applicable for variables, not for record items within process data.

1075 Individual record items may have less access rights than the record in general. This is
1076 indicated by the attribute 'accessRightRestriction'. For the access to the complete record, this
1077 means:

- If the Record is "rw" and the record item is restricted to "ro" the device shall tolerate
(ignore) the data written to this Subindex.

1080 Within the record item, the SimpleDatatype element allows any of the types derived from
1081 SimpleDatatypeT. Instead of defining simple data types inside the record definition, it is also
1082 possible to reference the definition of simple data types from the DatatypeCollection with
1083 DatatypeRef/@datatypeId.

- The attribute accessRightRestriction shall not be set to "wo". An exception to this rule
is the V_DirectParameters_1.

1086 Name (m)**1087 textId (m, RefT)**

1088 Assigns a human readable name to the record item. This name shall be displayed additionally
1089 by the IO-Link Tool.

1090 Description (o)**1091 textId (m, RefT)**

1092 Contains a description of the RecordItem (e.g. information text, help, etc.)

1093 Lexical representation:

1094 There is no lexical representation for a value of type RecordT.

1095 Alignment

1096 For variables only, integers shall start on an octet boundary. For optimization of transmission
1097 performance, this rule is not applicable for process data.

1098 If you have several booleans, it is highly recommended to group them together into one or few
1099 octets.

1100

1101 Examples:

1102 Regarding the notation see 19.

1103 Several Booleans in an Octet

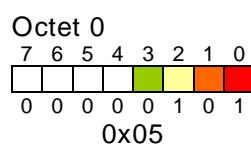

1104

```

1105 <Datatype xsi:type="RecordT" bitLength="4">
1106   <Name textId="TN_Switches"/>
1107   <RecordItem subindex="1" bitOffset="0">
1108     <SimpleDatatype xsi:type="BooleanT"/>
1109     <Name textId="TN_Switch1"/>
1110   </RecordItem>
1111   <RecordItem subindex="2" bitOffset="1">
1112     <SimpleDatatype xsi:type="BooleanT"/>
1113     <Name textId="TN_Switch2"/>
1114   </RecordItem>
1115   <RecordItem subindex="3" bitOffset="2">
1116     <SimpleDatatype xsi:type="BooleanT"/>
1117     <Name textId="TN_Switch3"/>
1118   </RecordItem>
1119   <RecordItem subindex="4" bitOffset="3">

1252   </RecordItem>
1253   <RecordItem subindex="2" bitOffset="1">
1254     <SimpleDatatype xsi:type="BooleanT"/>
1255     <Name textId="TN_Signal1"/>
1256   </RecordItem>
1257 </Datatype>
1258

```

1259

RecordItem	Subindex	Datentyp	bitLength	bitOffset	Value
1	1	BooleanT	—	0	false
2	2	BooleanT	—	1	true

1260

Octet 0	Octet 1
14 14 13 12 11 10 9 8 0 0 0 0 0 0 0 0	7 6 5 4 3 2 1 0 0 0 0 0 0 0 1 0
0x00	0x02

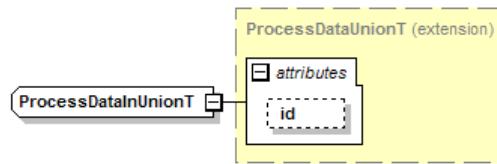

1261

1262 7.5.3.3 Process data union data types

The types ProcessDataInUnionT and ProcessDataOutUnionT are restricted to the description of the process data standard variables (Index 40 and 41) in IODD-StandardDefinitions1.1.xml and thus are not allowed in a normal IODD. The IO-Link Tool shall take the data type of the appropriate ProcessDataIn / ProcessDataOut element. If more than one ProcessDataIn / ProcessDataOut element is given, it is necessary to select the currently valid element by evaluating the Condition elements.

1269 7.5.3.3.1 ProcessDataInUnionT

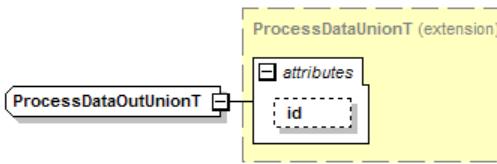

A ProcessDataInUnionT corresponds to the data type used in ProcessDataCollection/ProcessData/ProcessDataIn.

1272

Figure 23 – ProcessDataInUnionT**7.5.3.3.2 ProcessDataOutUnionT**

1275 A ProcessDataOutUnionT corresponds to the data type used in ProcessDataCollection/
 1276 ProcessData/ProcessDataOut.

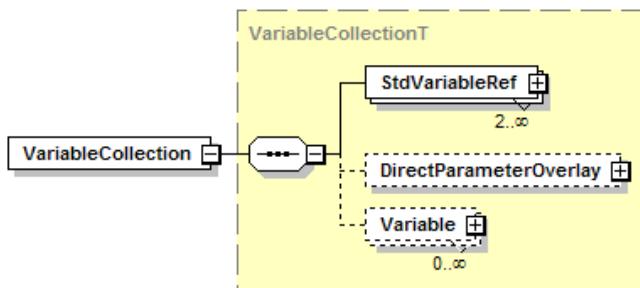

1277

Figure 24 – ProcessDataOutUnionT

1279

7.5.4 Variable collection

1281 All parameters of the device are included here. Standard parameters are defined in IODD-
 1282 StandardDefinitions1.1.xml and are referenced by StdVariableRef. DirectParameterOverlay
 1283 allows defining a Record which is being layed over the DirectParameterPage 2
 1284 (DirectParameters 16 – 31). All other device-specific variables are named under 'Variable'.

1285

Figure 25 – VariableCollection element

1287 All the variables that the device supports (i.e. the referenced standard variables, the direct
 1288 parameter overlay and the vendor specific variables) shall have unique Names within each
 1289 supported language.

7.5.4.1 StdVariableRef

1291 Here it is described, which of the standard variables are used. They are referenced here by an
 1292 explicit key. Because direct parameter page 1 is mandatory, the variable V_DirectParameters_1
 1293 shall always be referenced.

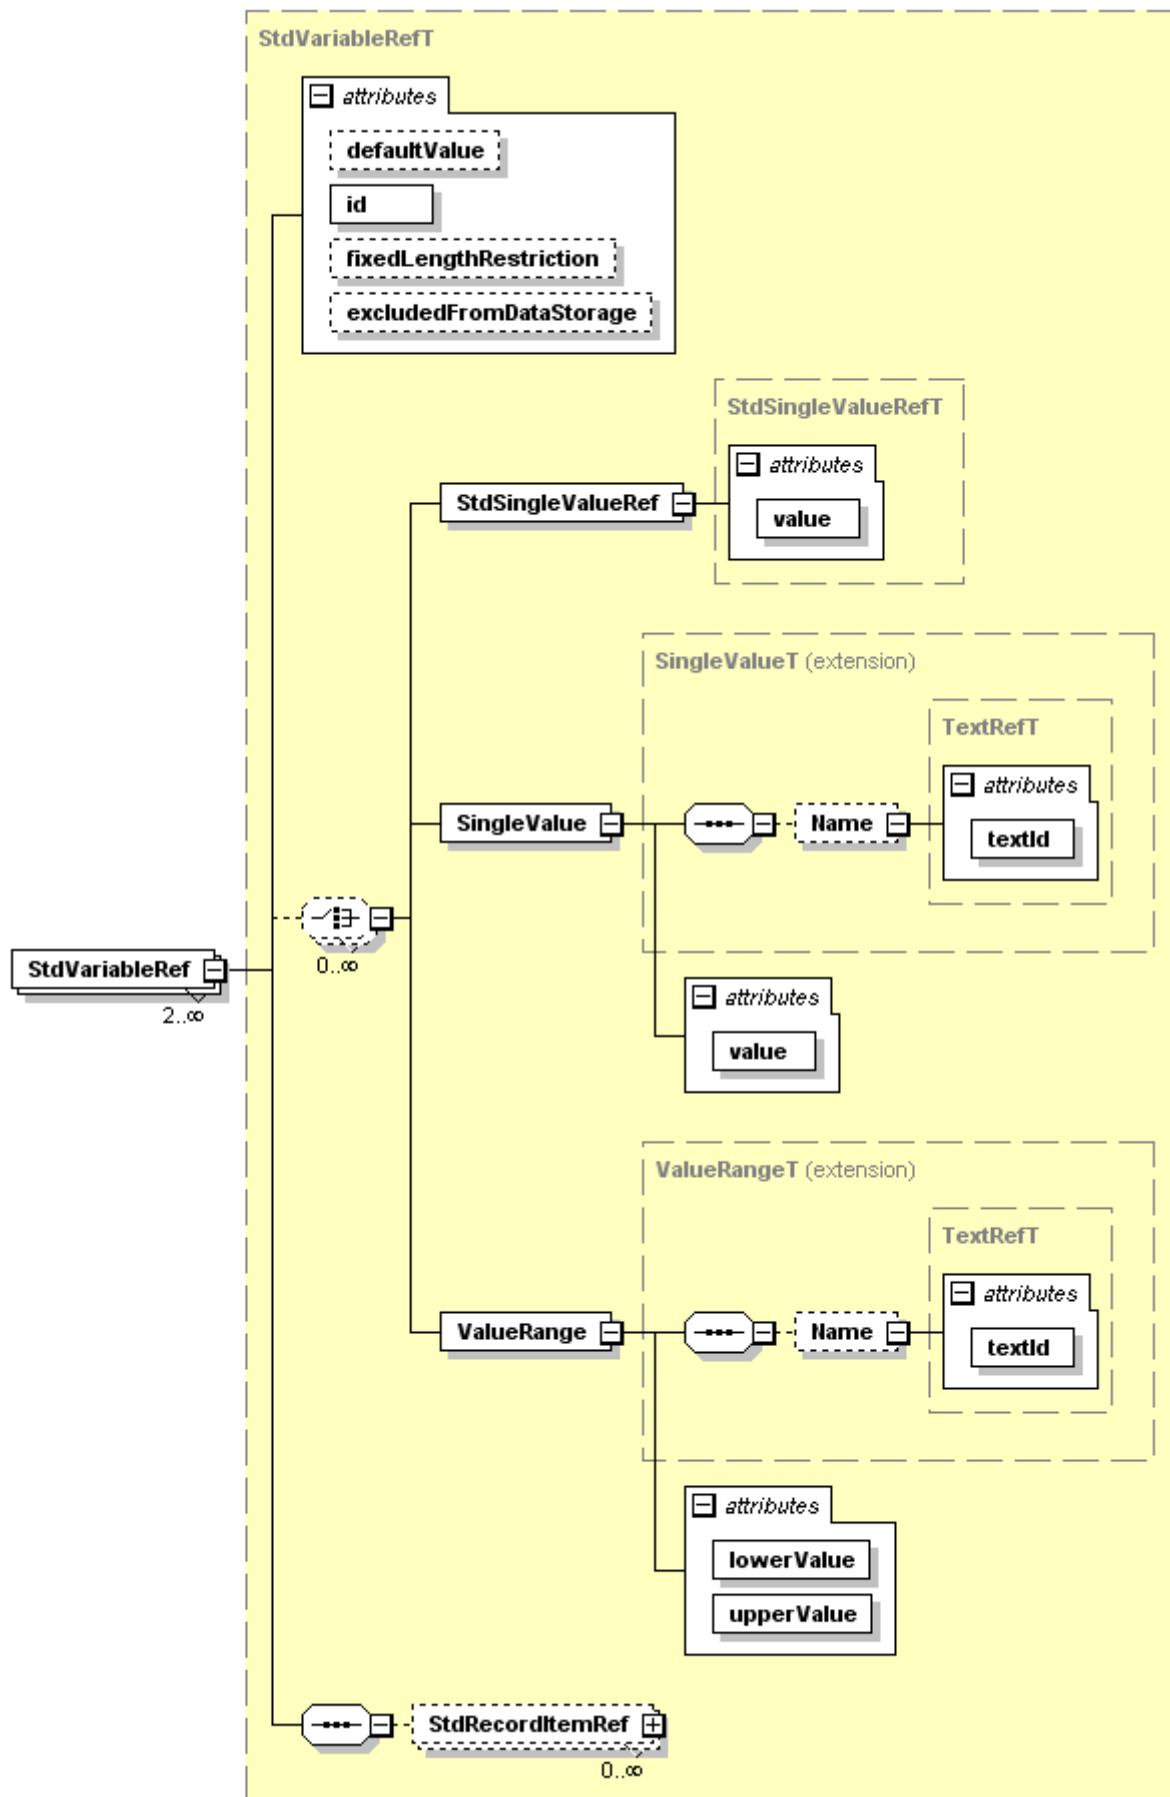

1294 It is highly recommended not to use V_DirectParameters_2 and ISDU in the same Device. Use
 1295 the V_DirectParameter_2 only if your Device does not support ISDUs at all.

1296 V_DirectParameters_2 and DirectParameterOverlay may only be present both or none. If V_
 1297 DirectParameters_2 and DirectParameterOverlay are present, V_DirectParameters_2 shall not
 1298 be referenced and DirectParameterOverlay shall be referenced in menu.

1299 All standard ISDU variables marked with the attribute mandatory="true" in the IODD-
 1300 StandardDefinitions1.1.xml shall be referenced if the device supports ISDU access. The
 1301 optional standard variables V_ProcessDataInput and V_ProcessDataOutput shall only be

1302 referenced if there is at least one ProcessDataIn / ProcessDataOut element in the
1303 ProcessDataCollection.

1304 The standard variables V_ProfileCharacteristic, V_PDIinputDescriptor, V_PDOoutputDescriptor
1305 shall neither be described nor be referenced in the IODE.

**Figure 26 – StdVariableRef element**

1308 id (m, IdT)

1309 This id is special since it can be both starting and end point of a referencing process. As end
1310 point of the referencing process, it contains the key of those variables within the IODE. As
1311 starting point, it references to a standard variable.

1312 defaultValue (o, anySimpleType)

1313 The defaultValue shall conform to the data type of the standard variable. Offline default value;
1314 it always refers to the complete variable. If the variable is a record, use StdRecordItemRef
1315 element(s) to specify default values for individual record items. On a variable of type array, the
1316 specified defaultValue shall be applied to all array members. For references to
1317 V_ProcessDataInput or V_ProcessDataOutput this attribute shall not be specified.

1318 For references to V_ProductID this attribute shall not be specified if more than one
1319 DeviceVariant is defined. If there is only one DeviceVariant, then the value of
1320 DeviceVariant/@productId shall be used as default value of V_ProductID.

1321 If more than one device variant is available, the defaultValue of V_ProductName should not be
1322 specified. Alternatively a substitute text covering all Device variants is allowed to be used as
1323 defaultValue. A specific name of any of the variants shall not be used.

1324 fixedLengthRestriction (o, SubindexT)

1325 Only applicable to standard variables of type string, octet string or array. Standard variables of
1326 types string or octet string have a 'fixedLength' attribute describing the maximum length that
1327 the IO-Link standard allows. A Device may implement standard variables with (octet) string
1328 shorter than what the IO-Link standard allows.

1329 Standard Variables of type array have a 'count' attribute describing the maximum size that the
1330 IO-Link standard allows. A Device may implement standard variables with arrays shorter than
1331 what the IO-Link standard allows.

1332 'fixedLengthRestriction' shall be less or equal to the 'fixedLength' (on standard variables of type
1333 string or octetstring) or 'count' (on standard variables of type array). If 'fixedLengthRestriction'
1334 is used with V_ApplicationSpecificTag, it shall be greater or equal to 16.

1335 excludedFromDataStorage (o, boolean)

1336 If set to "true", indicates that the contents of the standard variable are not stored with the data
1337 storage mechanism. This attribute may only be set to "true" for standard variables with
1338 accessRights = "rw". Within StdVariableRefs, excludedFromDataStorage can only be applied
1339 to V_ApplicationSpecificTag, V_DeviceAccessLocks and V_OffsetTime. The default is "false".

1340

1341 Allowed values:

1342 Only applicable to the standard variable V_SystemCommand and V_OffsetTime.

1343 StdSingleValueRef (o)

1344 Specifies a single supported standard value. The 'value' attribute shall match the 'value'
1345 attribute of a SingleValue defined at the standard variable.

1346 SingleValue (o)

1347 Specifies a single supported vendor-specific value with an optional name.

1348 ValueRange (o)

1349 Specifies a supported vendor-specific value range with an optional name.

1350 In addition to the above, the following rules shall apply for referencing for standard variables
1351 with StdVariableRef or StdRecordItemRef:

- 1352 • When neither SingleValue nor ValueRange nor StdSingleValueRef elements are given,
1353 the standard variable's value range as defined in IODE-StandardDefinitions1.1.xml is
1354 taken. This rule is not valid for V_SystemCommand.
- 1355 • When SingleValue(s) or ValueRange(s) or StdSingleValueRef(s) are given, only these
1356 values are allowed.

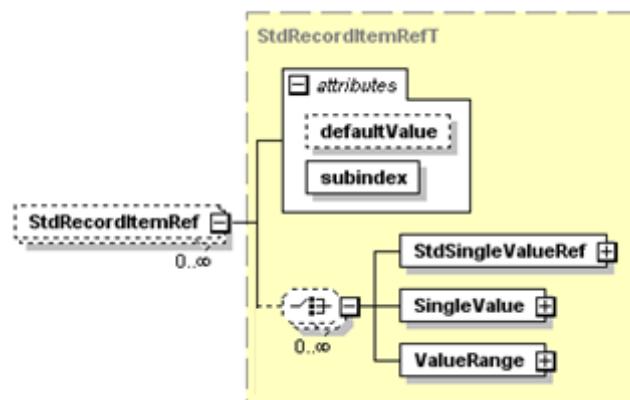

- 1357 • SingleValues and ValueRanges shall not overlap with SingleValues at the standard
 1358 variable, no matter whether these are referenced by StdSingleValueRef or not (i.e.
 1359 standard values can't be redefined in a vendor specific way).

1360 **StdRecordItemRef (o)**

1361 Used to specify additional information for RecordItems of standard variables. At least one of
 1362 the optional attributes and elements shall be present.

1363 For StdVariableRef id="V_DeviceAccessLocks", StdRecordItemRef is only allowed for those
 1364 subindices which refer to an access lock that is supported, i.e. where the respective attribute
 1365 in Features/SupportedAccessLocks is set to "true". It is recommended for
 1366 V_DeviceAccessLocks to specify StdRecordItemRef with a defaultValue for a specific
 1367 supported lock.

1368
1369

1370
1371

Figure 27 – StdRecordItemRef element

1372 **subindex (m, SubindexT)**

1373 Used for addressing the record item within the record. The subindex shall be unique within the
 1374 StdRecordItemRefs of a StdVariableRef.

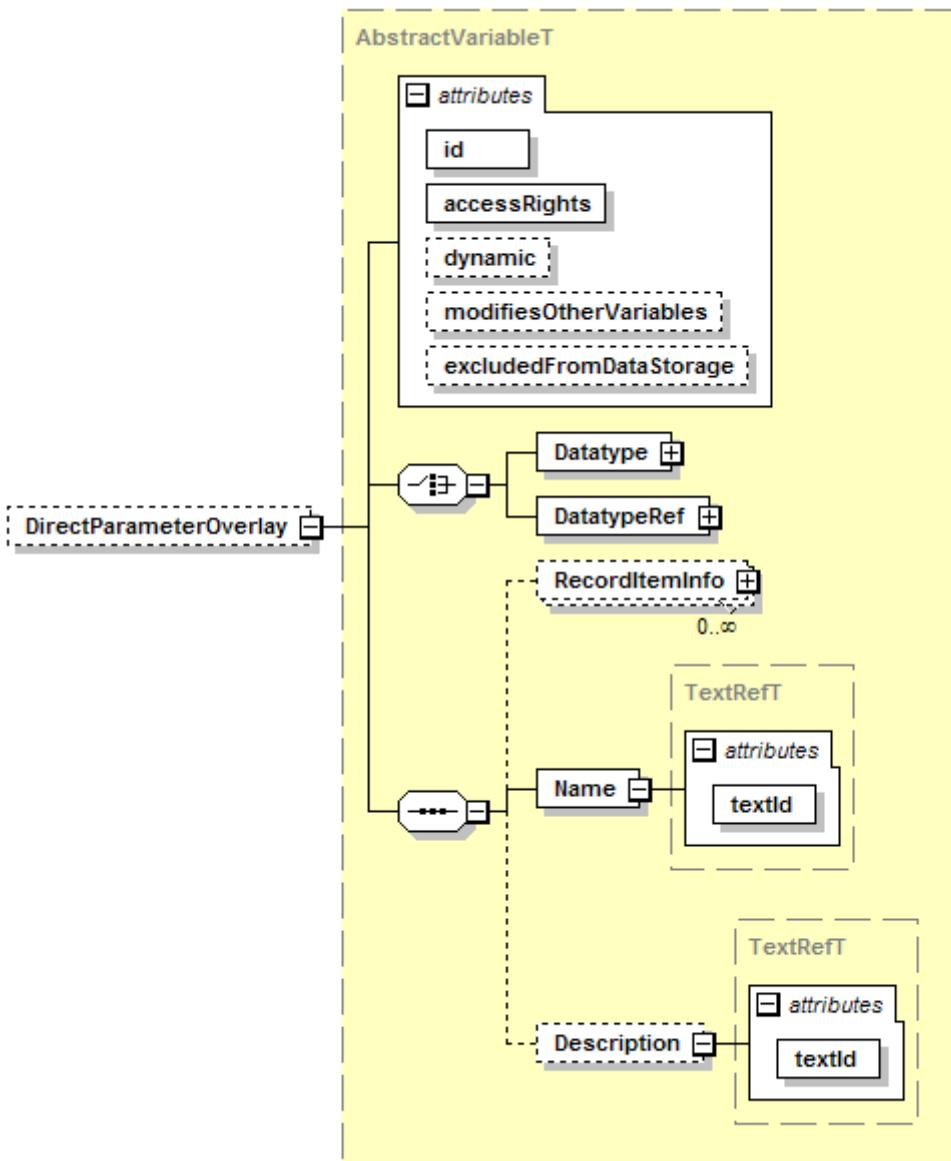

1375 **defaultValue (o, anySimpleType)**

1376 The defaultValue shall conform to the data type of the RecordItem. Offline default value.

1377 Specifying allowed values for a RecordItem using StdSingleValueRef, SingleValue and / or
 1378 ValueRange is only applicable to the standard variable V_DirectParameters_1, subindex 16
 1379 (system command for devices without ISDU support). The meaning and the rules regarding
 1380 these elements shall be the same as with the StdVariableRef element shown above.

1381 **7.5.4.2 DirectParameterOverlay**

1382 This element corresponds to the device-specific data within the DirectParameter page. If the
 1383 DirectParameterOverlay is used, TextRedefines should also be added to provide names for
 1384 each used DirectParameter octet (see chapter 14).

1385

1386

Figure 28 – DirectParameterOverlay element**1387 `id (m, IdT)`**

1388 As the end point of a referencing process, it contains the key of the variable within the IODE.
 1389 The id of any standard variable shall not be used as id for the DirectParameterOverlay, even if
 1390 the standard variable is not referenced from this IODE.

1391 `accessRights (m, AccessRightsT)`

1392 “ro”, read-only,
 1393 “wo”, write-only,
 1394 “rw”, read-write

1395 `dynamic (o, boolean)`

1396 Serves as information, whether the variable is autonomously changed by the device. This
 1397 attribute may only be set to “true” for DirectParameterOverlay with accessRights = “rw” or “ro”.
 1398 The default is “false”.

1399 `modifiesOtherVariables (o, boolean)`

1400 It is highly recommended to omit this attribute or set it to “false”.

1401 `excludedFromDataStorage (o, boolean)`

1402 It is highly recommended to omit this attribute or set it to “false”.

1403 Datatype (c)

1404 Directly given data type (see Note below)

1405 DatatypeRef (c)

1406 Reference to a data type that was defined in the DatatypeCollection (see Note below)

1407 RecordItemInfo (o)

1408 Contains additional information for record items. See 20.

1409 Name (m)**1410 textId (m, RefT)**

1411 Contains the name of the variable

1412 Description (o)**1413 textId (m, RefT)**

1414 Contains a description of the variable (e.g. information text, help, etc.)

1415 Note: The data type shall be a record with a minimum length of 1 bit and a maximum length of
 1416 128 bits. The last octet of this record is mapped to the last octet of the direct parameter page
 1417 2.

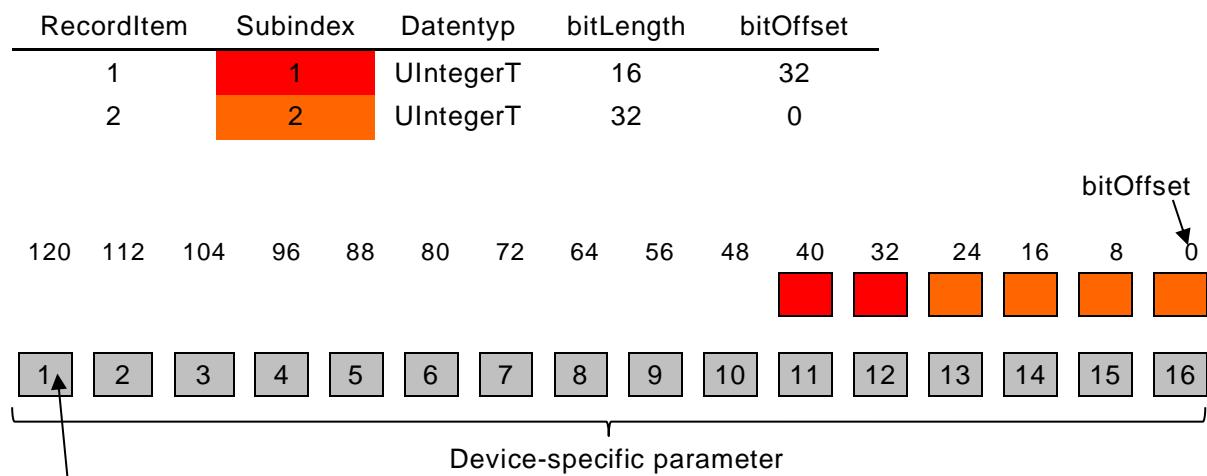

1418 Example

Figure 29 – Direct parameter overlay

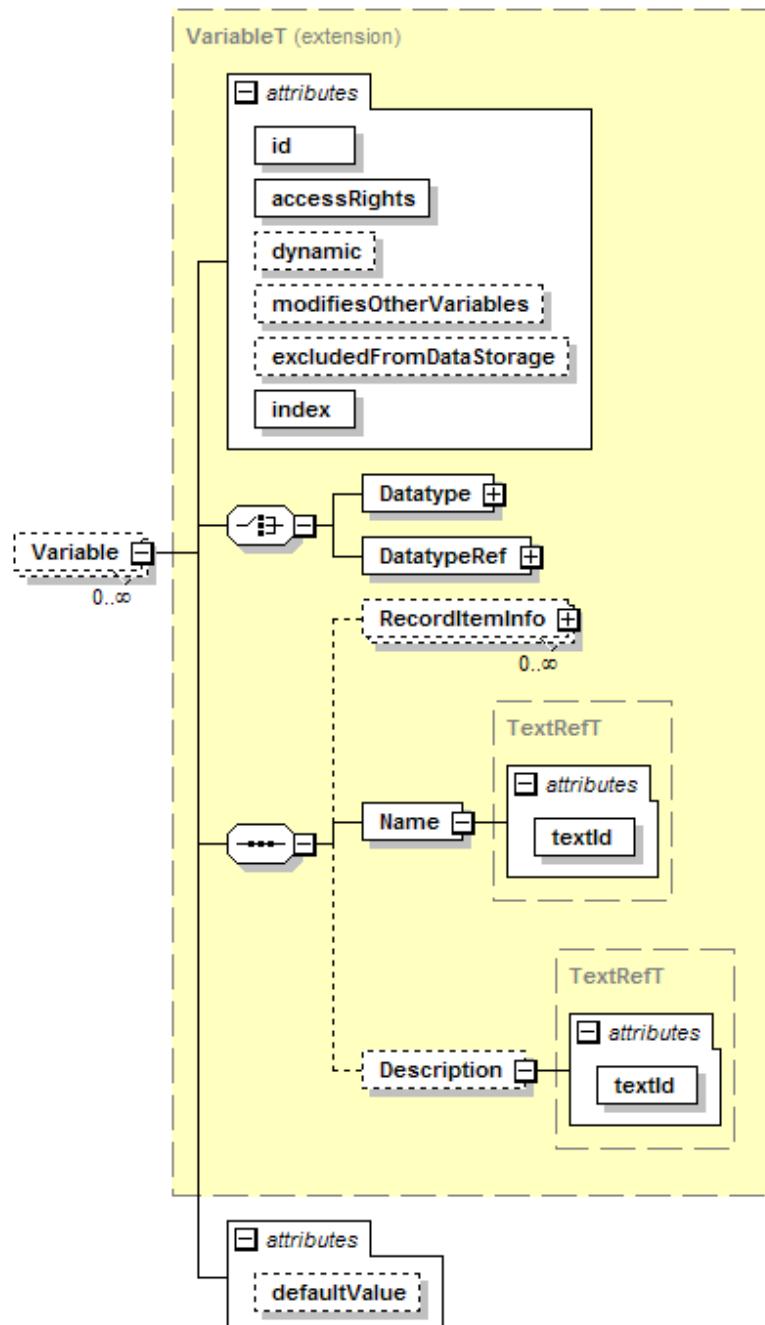

1426 Note: The communication of direct parameters is octet oriented.

- 1427 • For record items, which cross an octet boundary the consistency cannot be
1428 guaranteed.
- 1429 • If an octet contains more than one record item, the subindex access will influence all
1430 contained record items or parts.
- 1431 • For record items, which cross an octet boundary, the device cannot rely on the order of
1432 the single accesses. This means, the device shall tolerate intermediate values that may
1433 exceed the allowed value range.

1434 Recommendation: Use DirectParameterOverlay only for devices that do not support ISDU
1435 access.

1436 **7.5.4.3 Variable**

1437 Contains the description of a device parameter.

1438

1439

Figure 30 – Variable element**1440 id (m, IdT)**

1441 As the end point of a referencing process, it contains the key of the variable within the IODD.
 1442 The id of any standard variable shall not be used as id for the Variable, even if the standard
 1443 variable is not referenced from this IODD.

1444 accessRights (m, AccessRightsT)

1445 "ro", read-only,
 1446 "wo", write-only,
 1447 "rw", read-write

1448 For records and arrays the attribute accessRights='wo' is not permitted.

1449 **dynamic (o, boolean)**
 1450 Serves as information, whether the variable is autonomously changed by the device. This
 1451 attribute may only be set to "true" for variables with accessRights = "rw" or "ro". The default is
 1452 "false".

1453 **modifiesOtherVariables (o, boolean)**
 1454 If set to "true", indicates that a write access to this variable (or to any of its subindices) may
 1455 change the value of other variables. IO-Link Tools should re-load the variables of the device
 1456 after a write access to this variable. This attribute may only be set to "true" for variables with
 1457 accessRights = "rw" or "wo". The default is "false".

1458 **excludedFromDataStorage (o, boolean)**
 1459 If set to "true", indicates that this variable's contents are not stored with the data storage
 1460 mechanism. This attribute may only be set to "true" for variables with accessRights = "rw". The
 1461 default is "false".

1462 **index (m, unsignedShort)**
 1463 Index for the addressing of a variable. Shall be in the range for vendor specific indices or profile
 1464 specific indices that are not already described as standard variables in IODD-
 1465 StandardDefinitions1.1.xml.

1466 **defaultValue (o, anySimpleType)**
 1467 The defaultValue shall conform to the data type of the variable. Offline default value; it always
 1468 refers to the complete variable. If the variable is a record, use RecordItemInfo element(s) to
 1469 specify default values for individual record items. On a variable of type array, the specified
 1470 defaultValue shall be applied to all array members.

1471 **Datatype (c)**
 1472 Directly given data type

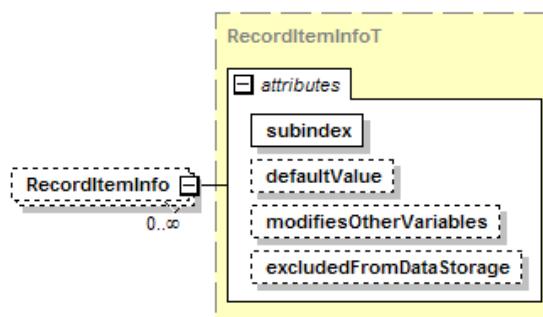

1473 **DatatypeRef (c)**
 1474 Reference to a data type that was defined in the DatatypeCollection

1475 **RecordItemInfo (o)**
 1476 Only applicable if the variable is of type record. Contains additional information for record items.
 1477 See 20.

1478 **Name (m)**
 1479 **textId (m, RefT)**
 1480 Contains the name of the variable

1481 **Description (o)**
 1482 **textId (m, RefT)**
 1483 Contains a description of the variable (e.g. information text, help, etc.)

1484 **7.5.4.4 RecordItemInfo**
 1485 For variables of type RecordT, contains optional attributes for a RecordItem addressed by the
 1486 subindex. At least one of the optional attributes shall be present.

1487
 1488

Figure 31 – RecordItemInfo element

1489 subindex (m, SubindexT)

1490 Used for addressing the record item within the record.

1491 defaultValue (o, anySimpleType)

1492 The defaultValue shall conform to the data type of the record item. Contains the default value
1493 for the RecordItem.

1494 modifiesOtherVariables (o, boolean)

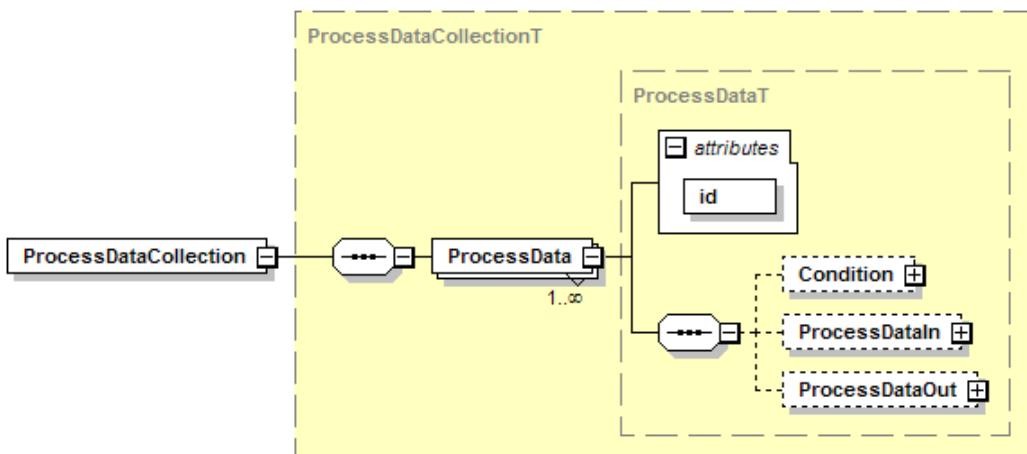

1495 If set to "true", indicates that a write access to this subindex may change the value of other
1496 variables. IO-Link Tools should re-load the variables of the device after a write access to this
1497 subindex. This attribute may only be set to "true" for record items with accessRights = "rw" or
1498 "wo". This attribute shall not be specified both on the DirectParameterOverlay/Variable element
1499 and a subordinated RecordItemInfo element. The default is "false".

1500 excludedFromDataStorage (o, boolean)

1501 If set to "true", indicates that this subindex's contents are not stored with the data storage
1502 mechanism. This attribute may only be set to "true" for record items with accessRights = "rw".
1503 This attribute shall not be specified both on the DirectParameterOverlay/Variable element and
1504 a subordinated RecordItemInfo element. The default is "false".

1505 7.5.5 Process data collection

1506 Contains all process data of the device

1507

Figure 32 – ProcessDataCollection element

1509 The element **ProcessData** may occur multiple times in the collection. If **ProcessData** occurs
1510 more than once,

- 1511 • all the **ProcessData** elements shall contain a **Condition** element
- 1512 • for each user role there shall be a menu (could be the same) that contains at least a read-only reference to the Variable / RecordItem used in the **ProcessData/Condition** elements
- 1514 • the attributes 'variableId' and 'subindex' in the **Condition** elements shall be the same (there
1515 shall only be exactly one variable / record item used for the switching of the process data)
- 1516 • the attribute 'value' in the **Condition** elements shall be unique within the **ProcessData**
1517 elements
- 1518 • the attribute 'bitLength' in the **ProcessDataIn** elements shall be the same for all
1519 **ProcessData**
- 1520 • the attribute 'bitLength' in the **ProcessDataOut** elements shall be the same for all
1521 **ProcessData**

- 1522 • the variable / record item referenced in the Condition elements selects the currently valid
 1523 ProcessData element when its value matches the ‘value’ attribute of the Condition element

1524 The attribute ‘id’ shall be unique within all the elements ProcessData, ProcessDataIn and
 1525 ProcessDataOut.

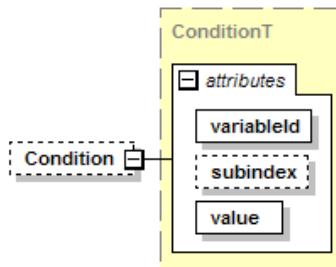

1526 **ProcessData (m)**

1527 **id (m, IdT)**

1528 Explicit id of the ProcessData

1529 **Condition (o)**

1530 Serves to switch between different ProcessData.

1531

Figure 33 – Condition element

1533 **variableId (m, RefT)**

1534 References a variable. The variable shall be of data type BooleanT, IntegerT, UIntegerT or
 1535 RecordT. The variable shall have a default value if it is not of type RecordT.

1536 **subindex (c, SubindexT)**

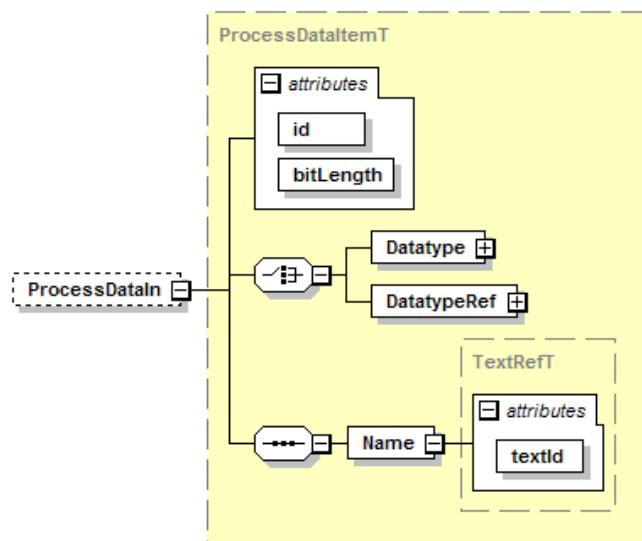

1537 This attribute shall be given if and only if the referenced variable is of type RecordT. Used for
 1538 addressing the record item within the record. The record item shall be of data type BooleanT,
 1539 IntegerT or UIntegerT and shall have a default value.

1540 **value (m, unsignedByte)**

1541 Shall be a valid value for the variable / record item. This attribute can only hold values 0..255,
 1542 thus limiting the possible IntegerT and UIntegerT values. Also, BooleanT condition values shall
 1543 be entered as “0” for “false” and “1” for “true”.

1544 **ProcessDataIn (o)**

1545 Description of the input process data

1546

Figure 34 – ProcessDataIn element

1548 **id (m, IdT)**
 1549 Explicit id of the ProcessDataIn description

1550 **bitLength (m, BitCountT)**
 1551 Length of the input process data (in bits). The allowed value range is 1..256.

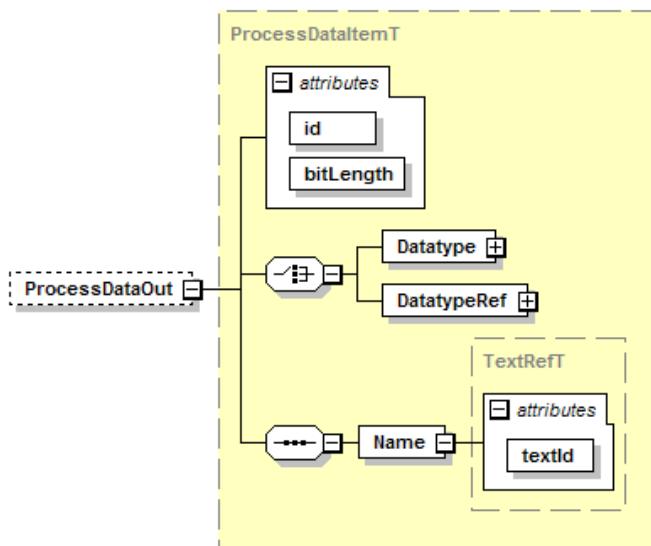

1552 It shall represent the underlying ProcessDataIn data type in a bit granular manner. For record
 1553 data types this bitLength shall equal the 'bitLength' attribute of the record.

1554 The value of the DirectParameterPage 1, subindex 5 (Process Data In), shall be calculated from
 1555 the 'bitLength' attribute value by the following formula:

```
1556     If bitLength <= 16 then
 1557         ProcessDataIn = bitLength
 1558     Else
 1559         ProcessDataIn = bitLength rounded up to the next multiple of 8
 1560     End If
```

1561 **Name (m)**
 1562 **textId (m, RefT)**
 1563 Name specification of the input process data

1564 **ProcessDataOut (o)**
 1565 Description of the output process data

1566
 1567 **Figure 35 – ProcessDataOut element**

1568 **id (m)**
 1569 Explicit id of the ProcessDataOut description

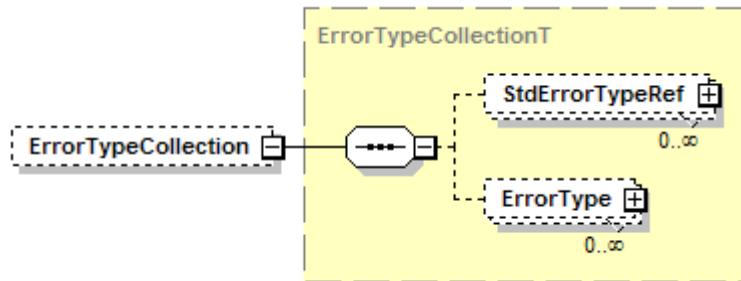

1570 **bitLength (m, BitCountT)**
 1571 Length of the output process data (in bits). The allowed value range is 1..256.

1572 The description of the 'bitLength' attribute at the ProcessDataIn element above also applies
 1573 here, but for Process Data Out (DirectParameterPage 1, subindex 6).

1574 **Name (m)**
 1575 **textId (m, RefT)**
 1576 Name specification of the output process data

1577 **7.5.6 Error type collection**
 1578 All error types that the device may return are collected here. There are system defined error
 1579 types (code=128) and vendor specific error types (code=129), see IO-Link Interface and System
 1580 Specification Version 1.1.3, annex C. The system defined error types are described in IODD-

1581 StandardDefinitions1.1.xml and referenced by 'StdErrorTypeRef', while the vendor specific
 1582 error types are specified with 'ErrorType'.

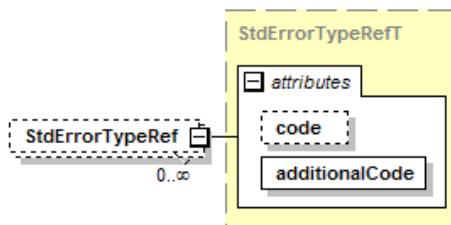

1583

Figure 36 – ErrorTypeCollection element

1585 StdErrorTypeRef (o)

1586 Standard error types are referenced by their 'additionalCode'.

1587

Figure 37 – StdErrorTypeRef element

1589 code (o, unsignedByte)

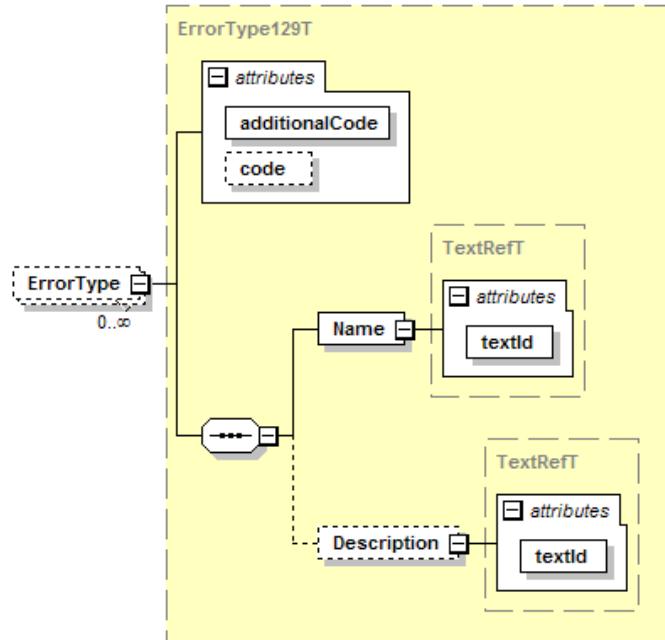

1590 Fixed to 128 by the IO-Link specification.

1591 additionalCode (m, unsignedByte)

1592 The additional code. Shall be unique within the 'StdErrorTypeRef' elements, and shall reference
 1593 one of the error types defined in IODD-StandardDefinitions1.1.xml.

1594 ErrorType (o)

1595 Vendor specific error type, identified by its 'additionalCode'.

1596

Figure 38 – ErrorType element

1598 **code (o, unsignedByte)**

1599 Fixed to 129 by the IO-Link specification.

1600 **additionalCode (m, unsignedByte)**

1601 The additional code. Shall be unique within the 'ErrorType' elements.

1602 **Name (m)**

1603 **textId (m, RefT)**

1604 Use this text for the error message.

1605 **Description (o)**

1606 **textId (m, RefT)**

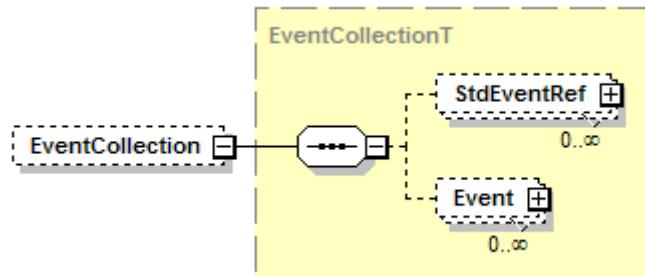

1607 Use this text for the possible cause of the error and the remedy.

1608 Error Types shall be handled by IO-Link Tools.

1609 Since a device can respond to an ISDU with an ErrorType, IO-Link Tools shall list all incoming
1610 ErrorTypes during an up- or download. Up- or downloads shall not be interrupted. If a tool
1611 supports device replication and the device responds with a single ErrorType, this replication
1612 shall be interrupted.

1613 7.5.7 Event collection

1614 All events that the device may return are collected here. There are system defined events and
1615 vendor specific events, see IO-Link Interface and System Specification Version 1.1.3, annex D.
1616 The system defined events are described in IODD-StandardDefinitions1.1.xml and referenced
1617 by 'StdEventRef', while the vendor specific events are specified with 'Event'.

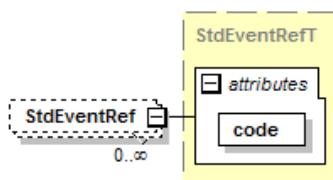

1618

Figure 39 – EventCollection element

1620 **StdEventRef (o)**

1621 Indicates that the device may return the standard event identified by the 'code'.

1622

1623

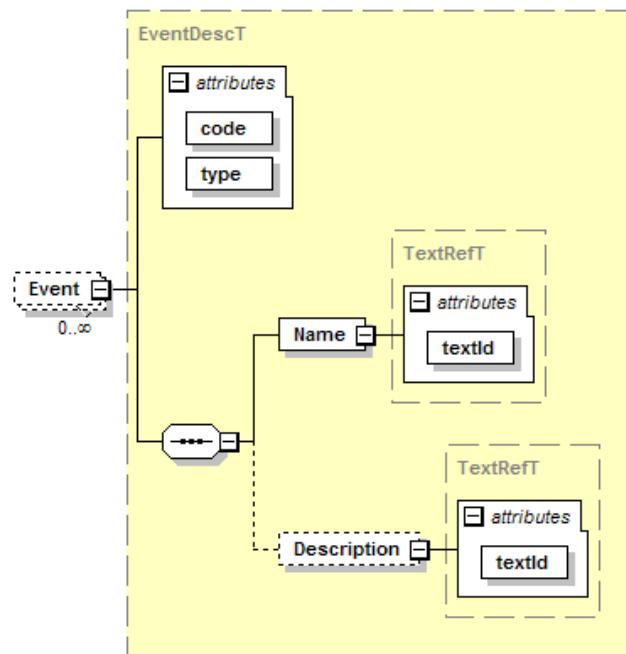

Figure 40 – StdEventRef element

1625 **code (m, unsignedShort)**

1626 The event code that identifies the standard event described in IODD-
1627 StandardDefinitions1.1.xml.

1628 **Event (o)**

1629 Describes a vendor specific event.

1630

1631

Figure 41 – Event element**1632 code (m, unsignedShort)**

The event code that identifies the vendor specific event. Shall be in the range for vendor specific or profile specific event codes.

1635 type (m, string)

The TYPE part of the EventQualifier (see IO-Link Interface and System Specification Version 1.1.3, chapter A.6.4). One of “Notification”, “Warning” or “Error”.

1638 Note that the MODE depends on the TYPE, SOURCE is always 0 (device application) and 1639 INSTANCE is always 4 (application).

1640 Name (m)**1641 textId (m, RefT)**

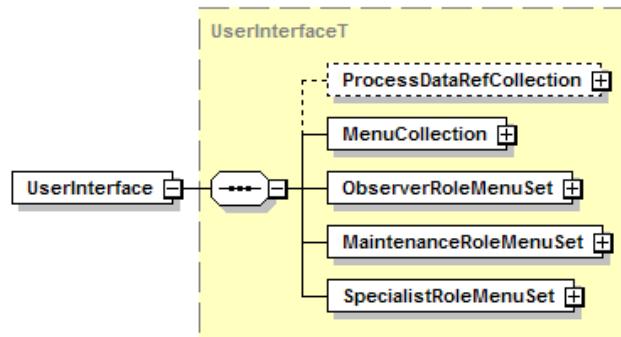

1642 Use this text for the event message.

1643 Description (o)**1644 textId (m, RefT)**

1645 Use this text for the possible cause of the event and the remedy.

1646 7.5.8 User interface

1647 Contains the menus of the device

1648

1649

Figure 42 – UserInterface element

7.5.8.1 ProcessDataRef collection (o)

1651 Some IO-Link masters support read access to the process data independently of the device.
1652 Process data read this way are shown in a separate menu by the IO-Link Tools for these
1653 masters. This collection allows defining how the process data read via the master are to be
1654 displayed.

1655 On the other hand, a device may support the optional standard variables V_ProcessDataInput
1656 / V_ProcessDataOutput for access to the process data. Usually these variables are then
1657 referenced from the Observation or Diagnosis menu. The 'VariableRef' or 'RecordItemRef'
1658 controls how the process data read from the device are to be displayed.

1659 Even if the device supports V_ProcessDataInput / V_ProcessDataOutput, when the
1660 'VariableRef' or 'RecordItemRef' uses attributes to control how the process data is displayed,
1661 the ProcessDataRefCollection should be entered using the same attribute values.

1662 If an IO-Link Tool wants to display process data and the IODD does not contain a corresponding
1663 ProcessDataRef for it, the tool shall display the process data just according to its data type.
1664 The tool shall not try to find the display format by walking the menus searching for
1665 V_ProcessDataInput / V_ProcessDataOutput references.

1666 Non referenced subindices shall not be displayed.

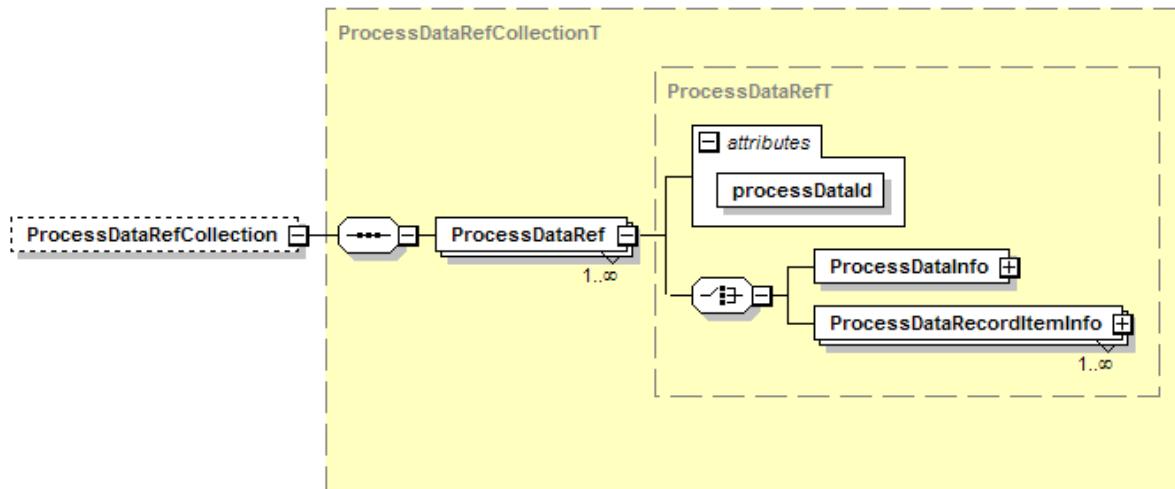

Figure 43 – ProcessDataRefCollection element

processDataId (m. RefT)

1670 Refers to DeviceFunction/ProcessData/ProcessDataIn or ProcessDataOut.

1671 ProcessDataInfo (c)

1672 Corresponds to the 'VariableRef' element of a menu except for 'accessRightRestriction' and
1673 'Button' which are not applicable (see 24).

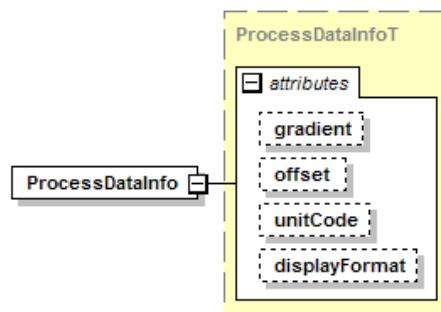

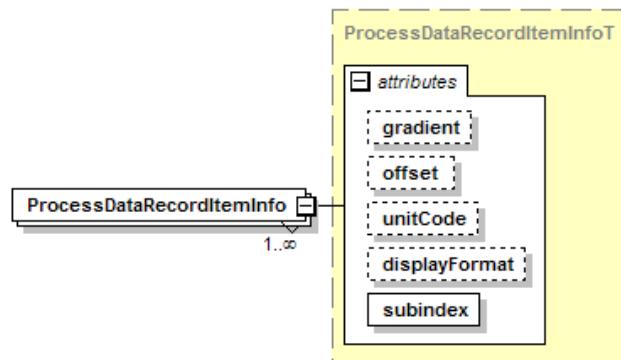

Figure 44 – ProcessDataInfo element

1676 Use this for process data which is not of type record.

1677 **ProcessDataRecordItemInfo (c)**

1678 Corresponds to the 'RecordItemRef' element of a menu except for 'accessRightRestriction' and
 1679 'Button' which are not applicable (see 25).

1680

Figure 45 – ProcessDataRecordItemInfo element

1682 Use this for process data which is of type record.

1683 **7.5.8.2 MenuSets (m)**

1684 **User Roles**

1685 A user interface shall be divided into three user roles. It is up to the vendor how the roles are
 1686 organized. The IO-Link Tool shall assign the entered UserLevel to the respective menu. At most
 1687 three menu levels below the role assignment are acceptable.

1688 Example:

1689 ObservationRoleMenuSet
 1690 → IdentificationMenu
 1691 → Menu1
 1692 → MenuRef1
 1693 → Menu2
 1694 → MenuRef1
 1695 MaintenanceRoleMenuSet
 1696 → ObservationMenu
 1697 → MenuX
 1698 → MenuRefY

1699 IO-Link Tools shall upload or download only the variables of the current user role. If the tool
 1700 supports a special function to replicate an IO-Link device, this function shall use the variables
 1701 of the specialist role and can be available in all user roles.

1702 **ObserverRoleMenuSet (m)**

1703 This menu is designed for users who may not carry out any modifications on the device.

1704 The role name in English: "Operator".

1705 **MaintenanceRoleMenuSet (m)**

1706 This menu is designed for observers and to undertake "uncritical" editing. It is up to the vendor
 1707 to assess that.

1708 The role name in English: "Maintenance".

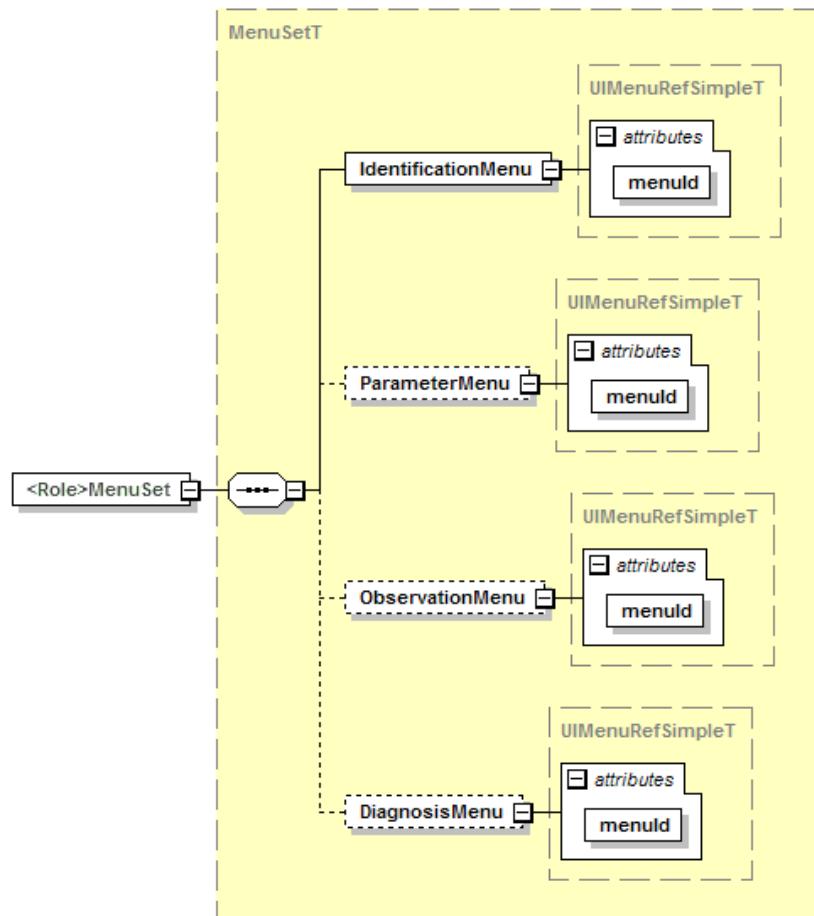

1709 **SpecialistRoleMenuSet (m)**

1710 If the user is logged in as a specialist, he/she has total access to the device. Again, the vendor
 1711 can decide which parameters may be edited.

1712 The role name in English: "Specialist".

1713

1714 For each role, there is a set of fixed top-level menus given.

1715

1716

Figure 46 – <Role>MenuSet element**1717 IdentificationMenu (m)**

1718 The attribute 'menuld' references a menu from the MenuCollection. This menu should contain
1719 variables which serve the identification of the device.

1720 The menu name in English: "Identification".

1721

1722 ParameterMenu (o)

1723 The attribute 'menuld' references a menu from the MenuCollection. This menu should contain
1724 variables which serve the parameterization of the device.

1725 The menu name in English: "Parameter".

1726

1727 ObservationMenu (o)

1728 The attribute 'menuld' references a menu from the MenuCollection. This menu should contain
1729 variables which serve the observation of the device (process data, dynamic variables, etc.).

1730 The menu name in English: "Observation".

1731

1732 DiagnosisMenu (o)

1733 The attribute 'menuld' references a menu from the MenuCollection. This menu should contain
1734 variables which serve the diagnosis of the device (events, etc.).

1735 The menu name in English: "Diagnosis".

1736

1737 The English 'name' definition within this chapter is translated into common languages, and the
1738 text templates are delivered within this package. If a tool supports one of those common
1739 languages, it shall apply only those translations.

1740

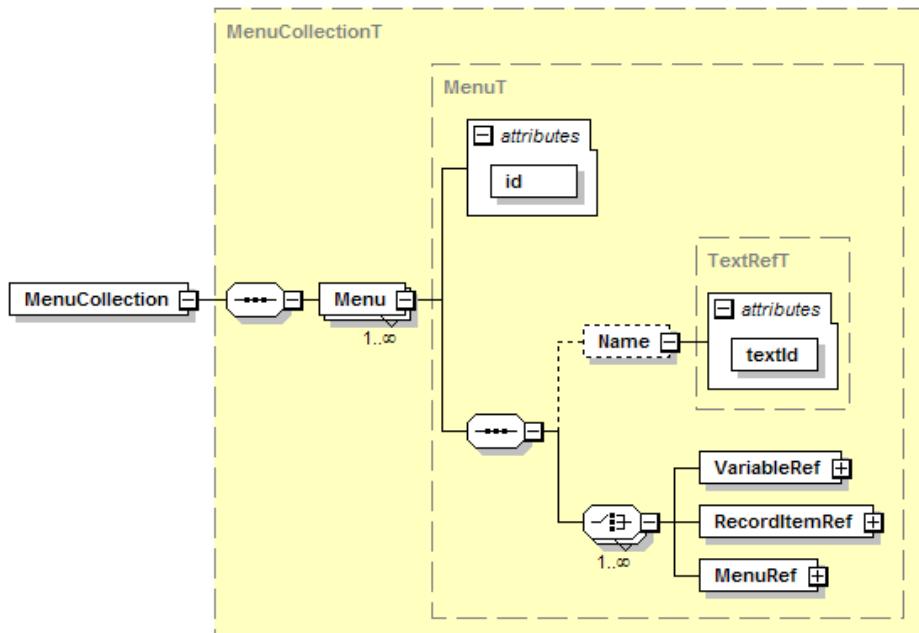

1741 7.5.8.3 Menu collection

1742 The names of top level menus, like IdentificationMenu, ParameterMenu, ObservationMenu or
1743 DiagnosisMenu are given from tooling. If a name is specified, it shall be ignored by tooling.

1744 In underlying menus, a menu name shall be given by IODD.

1745 **MenuCollection (m)**

1746 All menu entries of the device are collected in the MenuCollection. These menu entries may be
1747 referenced by different roles (ObserverRole, MaintenanceRole, and SpecialistRole). There shall
1748 be no unreferenced Menu elements.

1749

Figure 47 – MenuCollection element

1751 **Menu (m)**

1752 Variables, RecordItems and other menus may be referenced here.

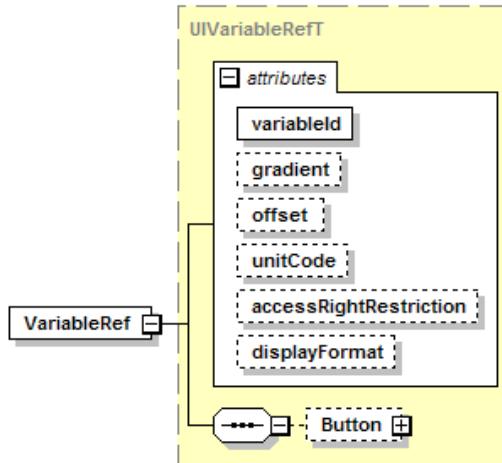

1753 **id (m, IdT)**

1754 Explicit id of the menu.

1755 **Name (c)**

1756 **textId (m, RefT)**

1757 Name of the menu. Top-level menus (i.e. those referenced from one of the MenuSets) may have
1758 a Name element, but it shall be ignored by IO-Link Tools. Instead, hard-coded names shall be
1759 used by the tools. Nested menus shall have a Name element which is shown by the tools.

1760 **7.5.8.4 VariableRef**

1761

1762

Figure 48 – VariableRef element1763 **variableId (m, RefT)**

1764 Referenced variable

1765 Regardless of the type of the referenced Variable or RecordItem, if gradient and / or offset are
1766 given, they shall be specified as floating point values.1767 **Displayed value = (value read from the Device x gradient) + offset**1768 When applying gradient and / or offset to convert the Variable or RecordItem value to the
1769 displayed value, the value will be implicitly converted to a floating point value. Consequently,
1770 the only allowed displayFormat on such values shall be "Dec". (The displayFormat "Hex",
1771 "Bin", ... does not force a conversion back to the original type of the Variable or RecordItem.)1772 When applying gradient and / or offset to convert an entered value back to the new value of a
1773 Variable or RecordItem, the resulting floating point value will be rounded to the nearest possible
1774 value of the type of the Variable or RecordItem.1775 Single array members can't be referenced with RecordItemRef. If you need to access a single
1776 member, you have to define a record instead of an array.1777 A variable of type array can only be referenced as a whole, i.e. with VariableRef. All the
1778 elements and attributes in VariableRef (gradient, offset, unitCode, accessRightRestriction,
1779 displayFormat and Button) apply to each of the array members.1780 **gradient (o, decimal)**1781 Gradient of the indicated variables. The value shall not be zero. When offset is specified and
1782 gradient is not specified, a value of 1.0 shall be used.1783 **offset (o, decimal)**1784 Zero-offset of the indicated variables. When gradient is specified and offset is not specified, a
1785 value of 0.0 shall be used.1786 **unitCode (o, positiveInteger)**1787 Unit code to which the indicated variable refers. For valid unit codes see IODD-
1788 StandardUnitDefinitions1.1.xml.

1789 unitCode shall only be used with datatypes UIntegerT, IntegerT and Float32T.

1790 unitCode shall only be used without displayFormat or with displayFormat Dec and Dec.x.

1791 **accessRightRestriction (o, AccessRightsT)**

1792 For certain UserRoles, the access rights may be limited here.

1793 The attribute accessRightRestriction shall not be set to “wo”.

1794 **displayFormat (o, string with pattern)**

1795 Specifies how an IO-Link Tool shall display the value in the menu. The values of the attribute
1796 ‘displayFormat’ shall follow the regular expression pattern:

1797 “Bin|Hex|Dec(.\d)?”

1798 Meaning of the values:

1799	Bin:	Binary notation with postfix “b”, e.g. 0101 1010 1010 0101b
1800	Hex:	Hexadecimal notation with postfix “h”, e.g. 5AA5h
1801	Dec:	Decimal notation without postfix, e.g. 23205
1802	Dec.2:	Decimal notation with given precision (number of digits after the decimal point) e.g. 23.00
1803		

1804 The following table shows the valid combinations of the data type of the referenced Variable /
1805 RecordItem and the displayFormat, gradient and offset. Combinations not listed here shall not
1806 be used.

1807 **Table 2 – Allowed combinations of datatype, displayFormat, gradient and offset**

datatype	allowed displayFormat	gradient and/or offset allowed	IO-Link Tool behaviour
BooleanT	Dec	No	Display as “0” for “false” and “1” for “true”.
	default	No	Display as “false” or “true”.
UIntegerT	Bin	No	Display as e.g. “0101 1010 1010 0101b”. Show 8, 16, 32 or 64 binary digits.
	Hex	No	Display as e.g. “5AA5h”. Show 2, 4, 8 or 16 hexadecimal digits.
	Dec	Yes	Without gradient and/or offset: Display as e.g. “23205”. Do not show leading zeroes. With gradient and/or offset: See Float32T, displayFormat=Dec
	Dec.x	Yes	Without gradient and/or offset: Display as e.g. “23205.00”. Do not show leading zeroes. With gradient and/or offset: See Float32T, displayFormat=Dec.x
	default	Yes	Same as Dec.
IntegerT	Bin	No	Display as e.g. “1111 1011 0010 1110b”. Show 8, 16, 32 or 64 binary digits. Show negative values as two’s complement.
	Hex	No	Display as e.g. “FB2Eh”. Show 2, 4, 8 or 16 hexadecimal digits. Show negative values as two’s complement.

	Dec	Yes	Without gradient and/or offset: Display as e.g. “-1234”. Do not show leading zeroes. With gradient and/or offset: See Float32T, displayFormat=Dec
	Dec.x	Yes	Without gradient and/or offset: Display as e.g. “-1234.00”. Do not show leading zeroes. With gradient and/or offset: See Float32T, displayFormat=Dec.x
	<i>default</i>	Yes	Same as Dec.
Float32T	Dec	Yes	Display digits after the decimal point as needed (up to an implementation-defined maximum).
	Dec.x	Yes	Display exactly “x” digits after the decimal point (also in exponential representation). Rounding shall be done with midpoint rounding away-from-zero (e.g. with “Dec.3” 23.3455 gets rounded to 23.346, and -23.3455 gets rounded to -23.346).
	<i>default</i>	Yes	Same as Dec.
StringT	<i>default</i>	No	Display just the string.
OctetStringT	<i>default</i>	No	Display as e.g. 0x00,0x56,0x78.
TimeT	<i>default</i>	No	Display as yyyy-mm-dd hh:mm:ss.fff where yyyy is the year, mm is the month, dd is the day, hh is the hour, mm is the minute, ss is the second and fff is the milliseconds.
TimeSpanT	<i>default</i>	No	Display as [+][d]hh:mm:ss.fff where d is the days (optional, one or more digits), hh is the hour, mm is the minute, ss is the second and fff is the milliseconds.
ArrayT	Display all array elements. Button is not allowed. The allowed displayFormat, gradient/offset and unitCode is determined by the data type of the array elements.		
RecordT	<i>default</i>	No	Display all RecordItems in the order in which they appear in the Record definition, i.e. with ascending subindices, with their default display format. Button and / or unitCode are not allowed.

1808 Some standard variables have complex types which are not modelled as special types in
 1809 IODE because:

- 1810 • The types cannot be used with other variables in a meaningful way.
- 1811 • The types are difficult to describe in XML, increasing the complexity of the IODE.
- 1812 • The types are IO-Link specific, complicating the general use of the IODE.

1813 These standard variables could be displayed as bare numbers the way they are described in
 1814 IODE-StandardDefinitions1.1.xml, but it is recommended that IO-Link Tools identify them by
 1815 their name or index and display them specially, as described in the following table:

1816 **Table 3 – Standard variables with special display**

Standard Variable / RecordItem	Special display
V_DirectParameters_1 (index 0), MasterCycleTime (subindex 2)	The octet consists of a Time Base in bits 7 to 6 and a Multiplier in bits 5 to 0. The IO-Link Tool shall calculate the time according chapter B.1.3 of the IO-Link Interface and System Specification Version 1.1.3 and display it as a decimal number with the unit milliseconds (ms).
V_DirectParameters_1 (index 0), MinCycleTime (subindex 3)	The octet consists of a Time Base in bits 7 to 6 and a Multiplier in bits 5 to 0. The IO-Link Tool shall calculate the time according chapter B.1.3 of the IO-Link Interface and System Specification Version 1.1.3 and display it as a decimal number with the unit milliseconds (ms).
V_DirectParameters_1 (index 0), M-sequence Capability (subindex 4)	The octet consists of a PREOPERATE M-sequence type in bits 5 to 4, an OPERATE M-sequence type in bits 3 to 1, and ISDU in bit 0. The IO-Link Tool shall decode this into text according to chapter B.1.4 of the IO-Link Interface and System Specification Version 1.1.3.
V_DirectParameters_1 (index 0), RevisionID (subindex 5)	The octet consists of a MajorRev in bits 7 to 4 and a MinorRev in bits 3 to 0. It shall be displayed as Vx.y, where x is the MajorRev and y is the MinorRev.
V_DirectParameters_1 (index 0), ProcessDataIn (subindex 6)	The octet consists of BYTE in bit 7, SIO in bit 6 and Length in bits 4 to 0. The IO-Link Tool shall display whether SIO is supported and the length in bits / octets according chapter B.1.6 of the IO-Link Interface and System Specification Version 1.1.3.
V_DirectParameters_1 (index 0), ProcessDataOut (subindex 7)	The octet consists of BYTE in bit 7, SIO in bit 6 and Length in bits 4 to 0. The IO-Link Tool shall display whether SIO is supported and the length in bits / octets according chapter B.1.7 of the IO-Link Interface and System Specification Version 1.1.3.
V_DetailedDeviceStatus (index 37)	Each array element shall be treated as an event data structure (see IO-Link Interface and System Specification Version 1.1.3, chapter A.6). It shall be decoded and displayed to text using the EventCollection in the IODE.

V_OffsetTime (index 48)	The octet consists of a Time Base in bits 7 to 6 and a Multiplier in bits 5 to 0. The IO-Link Tool shall calculate the time according chapter B.2.24 of the IO-Link Interface and System Specification Version 1.1.3 and display it as a decimal number with the unit milliseconds (ms).
V_DeviceAccessLocks (index 12)	V_DeviceAccessLocks shall only be referenced in menu via RecordItemRef to apply to the supported subindices, see chapter 7.5.8.5.

1817

1818	Octet 0	Octet 1	Octet 2
	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
	1 0 1 0 2 1 0	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
	MODE TYPE SOURCE INSTANCE	Event Qualifier	Event Code

Figure 49 – Event data structure

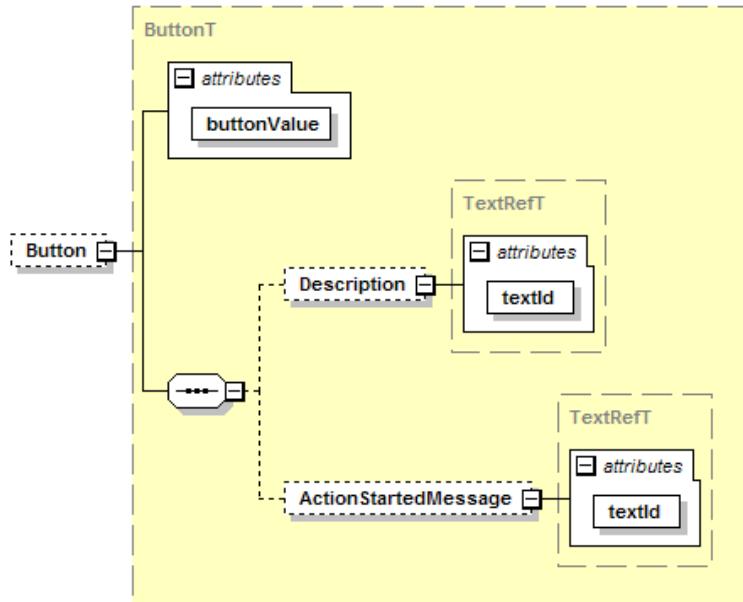

1820 **Button (o)**

Buttons are intended for implementing a command interface to the device. Several commands can be implemented on the same variable / record item using different values to be written.

1823 If this element is given, the IO-Link Tool shall display a button instead of a value. The attributes
1824 'gradient', 'offset', 'unitCode' and 'displayFormat' shall not be used when the element 'Button'
1825 is present.

1826 The button shall be labelled with the Name that is given to the SingleValue at the data type of
1827 the referenced Variable or RecordItem whose 'value' corresponds to the 'buttonValue'.

1828 Use of this element is restricted to the data types BooleanT, UIntegerT and IntegerT, but it is
1829 highly recommended to use data type UIntegerT with bitLength="8" Note that this does not
1830 include arrays of these data types.

1831

1832

Figure 50 – Button element

1833 A variable referenced as “Button”
1834 shall have accessRights “wo”

1835 shall only be displayed as a button
 1836 shall not be used as a condition variable, to switch menus or process data.

1837 The buttonValue
 1838 will be sent to the device immediately by pushing the button.
 1839 shall not be part of the block-download sequence.

1840 **buttonValue (m, union of boolean, unsignedLong and long)**
 1841 This value shall correspond to a SingleValue/@value of the data type of the referenced Variable or RecordItem. It is sent to the device when the button is clicked.

1843 **Description (c)**
 1844 **textId (m, RefT)**
 1845 A text that explains the action that will be started by pressing the button.

1846 • For button values described as StdSingleValueRef, the Description Element is mandatory.
 1847 The definition in template IODD-SystemCommandDefinitions_V113.xml shall be used.

1848 • For button values described as SingleValue the Description Element is optional.

1849

1850 **ActionStartedMessage (o)**
 1851 **textId(m, RefT)**

1853 A text that is shown after the button value was successfully sent to the device. Use this as a feedback to the user for actions that may take a while to complete or that require some user action to complete.

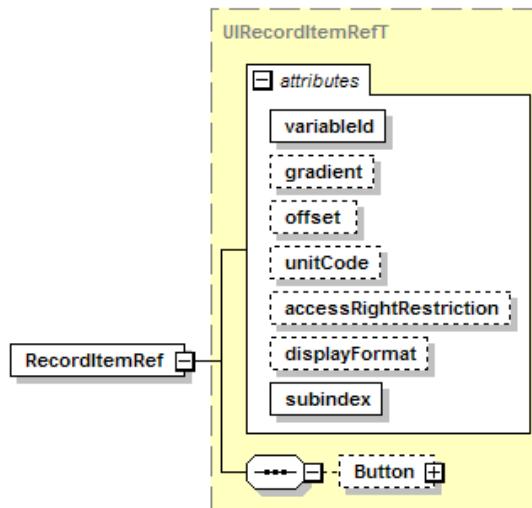

1856 ActionStartedMessages shall be omitted for buttons referencing StdSingleValueRefs
 1857 [@id="128" or "129" or "130" or "131"].

1858

1859 **7.5.8.5 RecordItemRef**

1860 Corresponds to VariableRef with an additional subindex. The variable referenced by variableId shall be of type record. If 'Button' is specified, the referenced variable shall support subindex access. A RecordItemRef with variableId="V_DeviceAccessLocks" is only allowed for those subindices which refer to an access lock that is supported, i.e. where the respective attribute in Features/SupportedAccessLocks is set to "true".

1865

1866

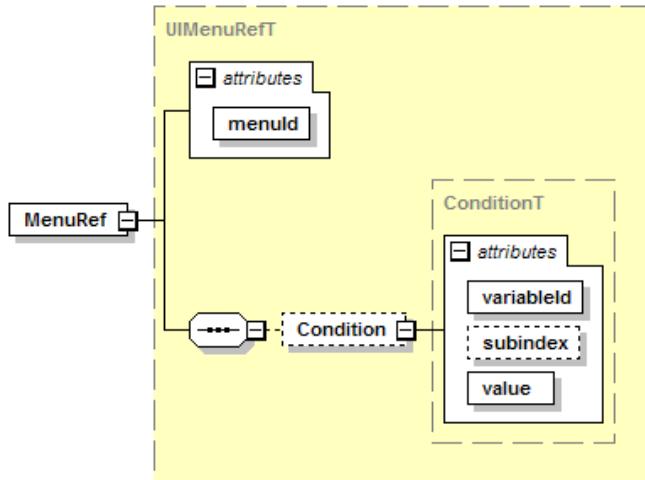

Figure 51 – RecordItemRef element

1868 **subindex (m, SubindexT)**
 1869 Addresses the record item of a variable of type record.

1870 For the other attributes and the element ‘Button’, see VariableRef above.

1871 7.5.8.6 MenuRef

1872 Reference to a (sub)menu nested inside this menu.

1873

Figure 52 – MenuRef element

1875 **menuld (m, RefT)**

1876 References the (sub)menu from the MenuCollection.

1877 **Condition (o)**

1878 Condition for the display of this menu; an IO-Link Tool shall show the referenced menu only if
1879 the value of the referenced variable / record item equals the value of the attribute ‘value’.

1880 **variableId (m, RefT)**

1881 References a variable. The variable shall be of data type BooleanT, IntegerT, UIntegerT or
1882 RecordT. The variable shall have a default value if it is not of type RecordT.

1883 **subindex (c, SubindexT)**

1884 This attribute shall be given if and only if the referenced variable is of type RecordT. Used for
1885 addressing the record item within the record. The record item shall be of data type BooleanT,
1886 IntegerT or UIntegerT and shall have a default value.

1887 **value (m, unsignedByte)**

1888 Shall be a valid value for the variable / record item. This attribute can only hold values 0..255,
1889 thus limiting the possible IntegerT and UIntegerT values. Also, BooleanT condition values shall
1890 be entered as 0 for “false” and 1 for “true”.

1891 Conditions may be used in all menu levels.

1892 Condition variables shall appear as VariableRef or RecordItemRef at least in a read-only way
1893 in a menu which is referenced in the same user role.

1894 If there is more than one ProcessData element, selected by conditions, and the variable
1895 V_ProcessDataInput or V_ProcessDataOutput is referenced in a menu, one of the following
1896 shall hold:

- 1897 • The type of reference (VariableRef / RecordItemRef) and the gradient, offset, unitCode
1898 and displayFormat fit to each of the ProcessData elements.

- 1899 • The menu is conditioned in the same way as one of the ProcessData elements, and the
1900 type of reference (VariableRef / RecordItemRef) and the gradient, offset, unitCode and
1901 displayFormat fit to this particular ProcessData element.

1902 “Conditioned in the same way” means that this or one of the parent menus has the same
1903 condition (same variable, same subindex, same value).

1904

1905 7.5.9 Rules for write-only variables

1906 For variables with accessRights="wo" (write-only) the following rules shall be considered. If not
 1907 accompanied with attribute displayFormat="button":

- 1908 • "wo"- Variables generally are handled as commands
- 1909 • "wo"- Variables are edited like any other variable
- 1910 • "wo"- Variables shall never be part of any download sequence
- 1911 • "wo"- Variables shall always be handled as a single write request

1912 7.6 Communication characteristics

1913

1914 **Figure 53 – CommNetworkProfile element**

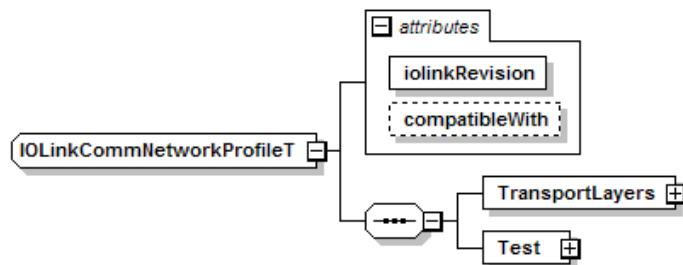

1915 Excursion on XML schema *abstract types*:

1916 An abstract type can't be used itself. Only non-abstract types which are derived from an
 1917 abstract type can be used. The instance selects the desired derived type with xsi:type= "*name*
 1918 of the derived type".

1919 This technique is used here with the 'CommNetworkProfile' element to adapt the XML structure
 1920 to the requirements of the specific communication. This allows easy extension of the IODD to
 1921 non-IO-Link devices with different communication characteristics as long as the applicative
 1922 concept remains the same (i.e. addressing via index/subindex, standardized variables).

1923 7.6.1 IOlinkCommNetworkProfileT

1924 For IO-Link, the following derived type IOlinkCommNetworkProfileT describes the
 1925 communication characteristics of an IO-Link interface.

1926

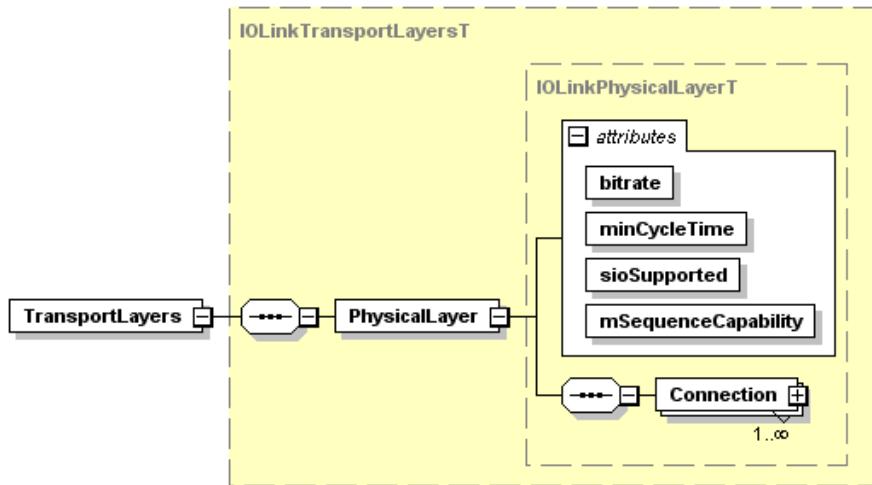

1927 **Figure 54 – CommNetworkProfile element – IO-Link variant**

1928 **iolinkRevision (m, VersionT)**

1929 Implemented protocol version. Fixed to "V1.1".

1930 **compatibleWith (o, VersionT restricted to "V1.0")**

1931 Specify this attribute if the device is compatible with IO-Link revision 1.0, i.e. also runs on a
 1932 V1.0 IO-Link Master. This requires an IODD V1.0.1 (or V1.0).

1933 **TransportLayers (m)**

1934

1935 **Figure 55 – TransportLayers element – IO-Link variant**1936 **PhysicalLayer (m)**1937 **bitrate (m, string)**

1938 Allowed values are “COM1”, “COM2” or “COM3”.

1939 **minCycleTime (m, unsignedInt)**1940 The minimum cycle time of the slave; specified in 1 microsecond (μ s) units. E.g. the value
1941 2300 represents 2.3 milliseconds (ms). The allowed value range is 0..6300 in steps of 100,
1942 6400..31600 in steps of 400 and 32000..132800 in steps of 1600 (see IO-Link Interface and
1943 System Specification Version 1.1.3, chapter B.1.3).1944 **sioSupported (m, boolean)**

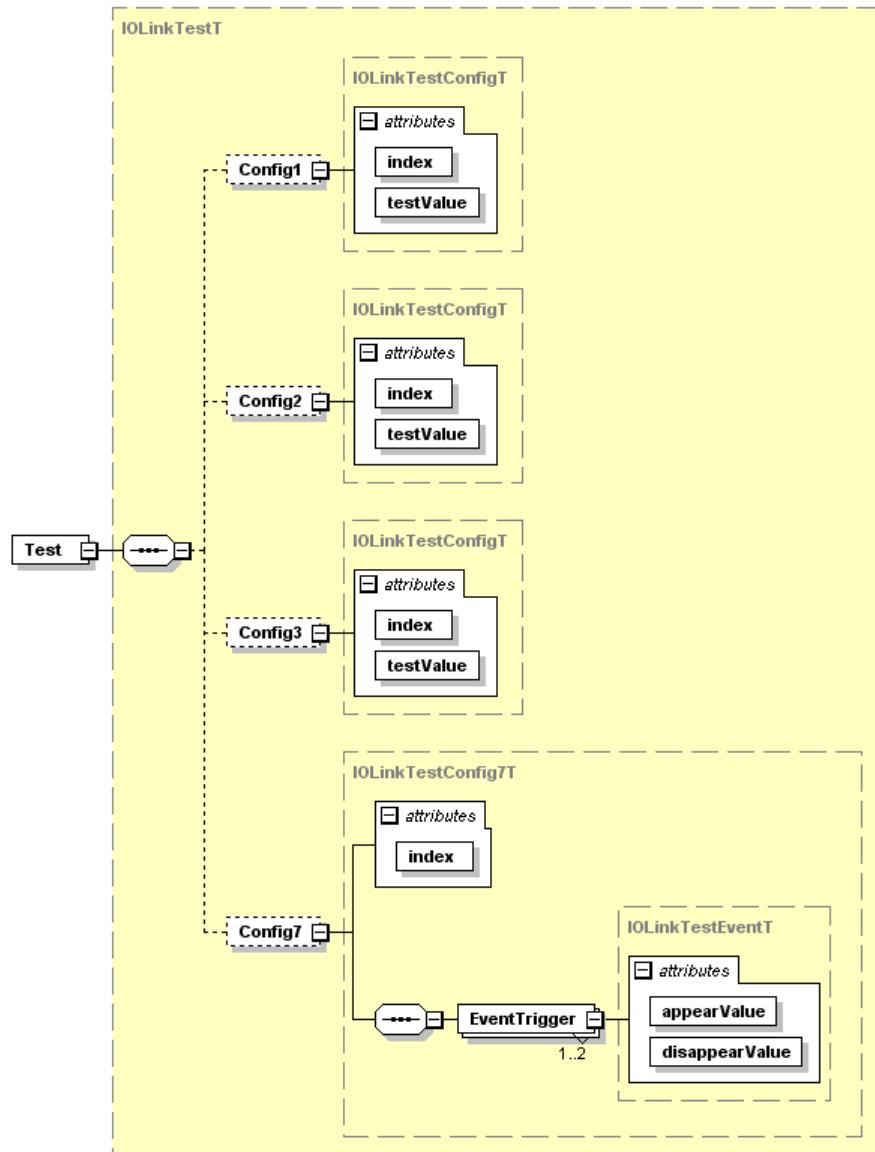

1945 Whether the fall-back to SIO mode is supported.

1946 **mSequenceCapability (m, unsignedByte)**1947 Enter the content of V_DirectParameters_1, subindex 4 (M-sequence Capability) here as a
1948 decimal number.1949 **Test (m)**

1950 Contains information to enable automatic testing of the device.

1951 Enter appropriate data for the ISDU and event test configurations (see IO-Link Test

1952 Specification Version 1.1.3).

**Figure 56 – Test element**

1953

1954

Config1 (c)

1955 Shall be present if the device supports ISDU access, and refers to a read-write 8 bit index. The
 1956 testValue shall be small enough (≤ 12 octets) so that the ExtLength coding of the ISDU is not
 1957 used.

Config2 (c)

1958 Shall be present if the device supports ISDU access, and refers to a read-write 16 bit index. If
 1959 the device supports a read-write variable on such an index, the testValue shall be accepted by
 1960 the device. If the device does not support such an index a valid ErrorType shall be returned
 1961 (Index not available).

Config3 (c)

1962 Shall be present if the device supports ISDU access, and refers to a read-write 8 bit index. The
 1963 testValue shall have a length big enough (> 12 octets) to cause the ExtLength coding of the
 1964 ISDU.

Config7 (c)

1965 Shall refer to an index raising different types of events. For details, please refer to the IO-Link
 1966 Test Specification.

index (m, RefT)

1967 References an Index to be used for testing.

1973 **testValue (m, string with pattern: “(0x[0-9A-Fa-f][0-9A-Fa-f],)*0x[0-9A-Fa-f][0-9A-Fa-f]”)**
 1974 Shall be an acceptable octet string value for the index.

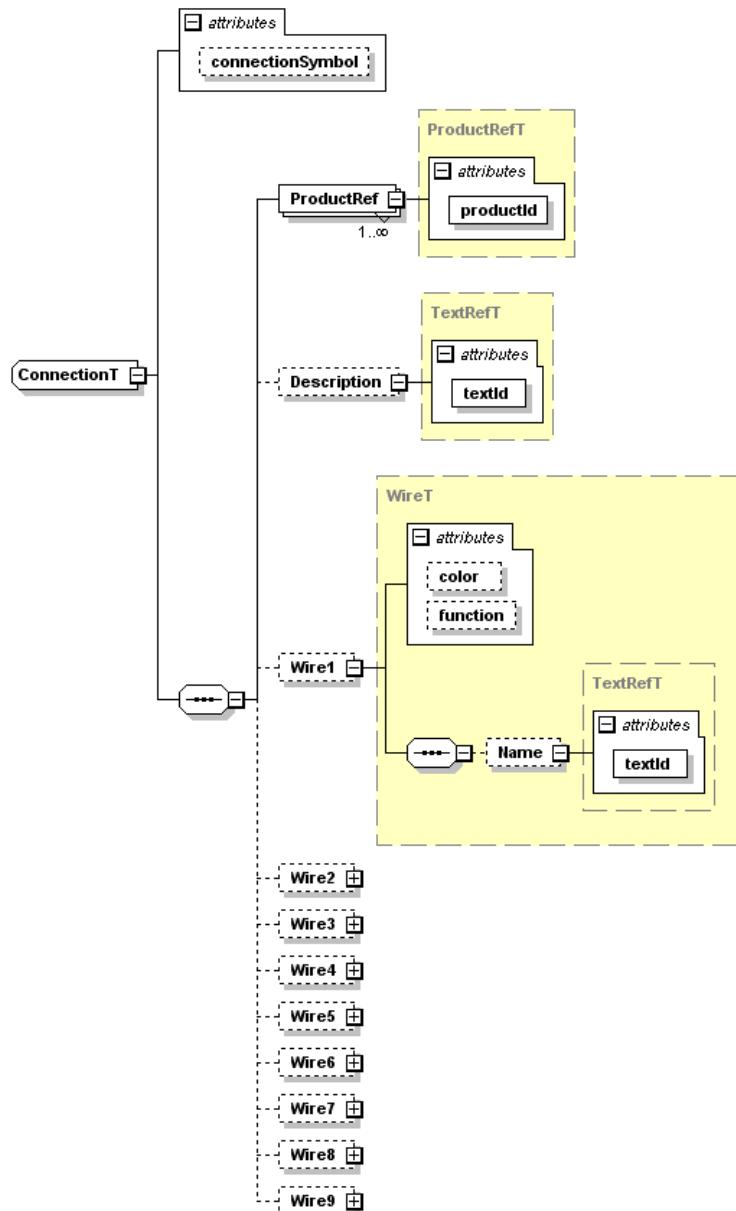

1975 **EventTrigger (m)**
 1976 Trigger values for up to two events.

1977 **appearValue (m, unsignedByte)**
 1978 The value that triggers an event when written to Config7/@index.

1979 **disappearValue (m, unsignedByte)**
 1980 The value that quenches the event triggered by @appearValue when written to Config7/@index.

1981 **Connection (m)**
 1982 Describes, how the device can be connected. A Connection may be used for multiple device
 1983 variants, which are referenced by the ProductRef/@productId attributes.

1984 This element has the following XML abstract type:

1985

1986

Figure 57 – ConnectionT abstract type

- 1987 **connectionSymbol (o, string with pattern “(\p{L}\d_#]+-)+con-pic.png”)**
 1988 File name of the connection symbol. If this attribute is used, the referenced image file shall be
 1989 present.
- 1990 **ProductRef (m)**
 1991 **productId (m, string)**
 1992 Selects the device variants that use this Connection. Shall correspond to one of the
 1993 DeviceIdentity/DeviceVariantCollection/DeviceVariant/@productId values.
- 1994 **Description (o)**
 1995 **textId (m, RefT)**
 1996 Description of the connection.
- 1997 **Wire<X>**
 1998 Describes one of the wires. If the connection is some type of connector, the number <X> also
 1999 designates the pin / hole number.
- 2000 For OtherConnectionT and CableConnectionT, if the number of wires exceeds 9, the wires
 2001 relevant for IO-Link shall be described. In this case, the <X> does not necessarily equal the pin
 2002 / hole number. The real pin number should be described in the Wire<X>/Name element.
- 2003 **color (o, string)**
 2004 A color code according to IEC 60757:1983.

Table 4 – Wire colors

Code	Color
“BK”	Black
“BN”	Brown
“RD”	Red
“OG”	Orange
“YE”	Yellow
“GN”	Green
“BU”	Blue (including light blue)
“VT”	Violet (purple)
“GY”	Grey (slate)
“WH”	White
“PK”	Pink
“GD”	Gold
“TQ”	Turquoise
“SR”	Silver

- 2006
 2007 **function (o, string)**
 2008 The function of the wire.

Table 5 – Wire functions

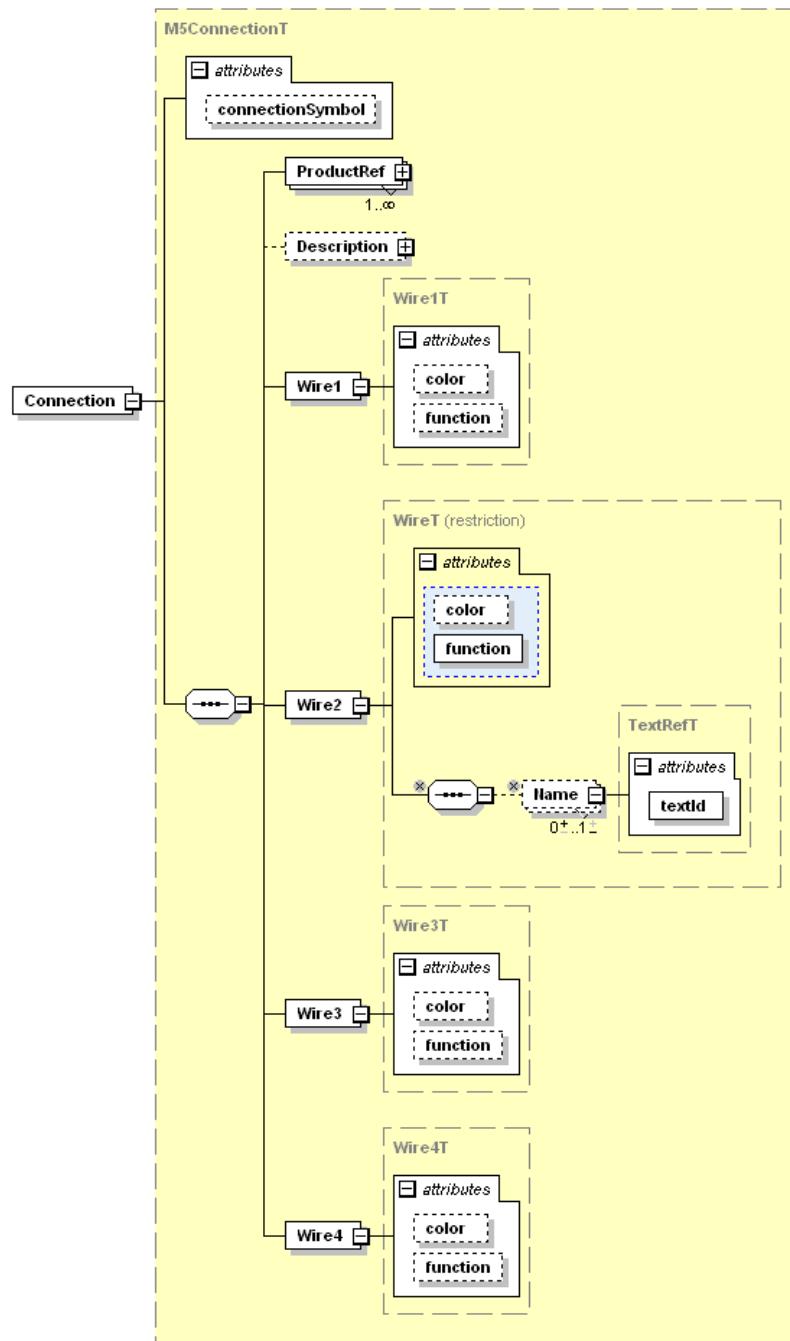

Function	Description
“NC”	Not connected
“L+”	Power supply (+), pin 1, brown
“L-”	Power supply (-), pin 3, blue
“P24”	Extra power supply (+)
“N24”	Extra power supply (-)
“Other”	e.g. signal (DI, DO, analog) or power supply
“C/Q”	Communication signal, pin 4, black

- 2010
 2011 **Name (o)**
 2012 **textId (m, RefT)**
 2013 An additional textual description of the wire. Do not repeat the wire color or wire function in
 2014 textual form here.

2015 The allowed XML derived types are: M5ConnectionT, M8ConnectionT, M12-4ConnectionT, M12-5ConnectionT, OtherConnectionT and CableConnectionT. They restrict the abstract type accordingly.

2018 **M5ConnectionT**

2019 The M5 connector as specified in IO-Link Interface and System Specification Version 1.1.3, chapter 5.5.

2021

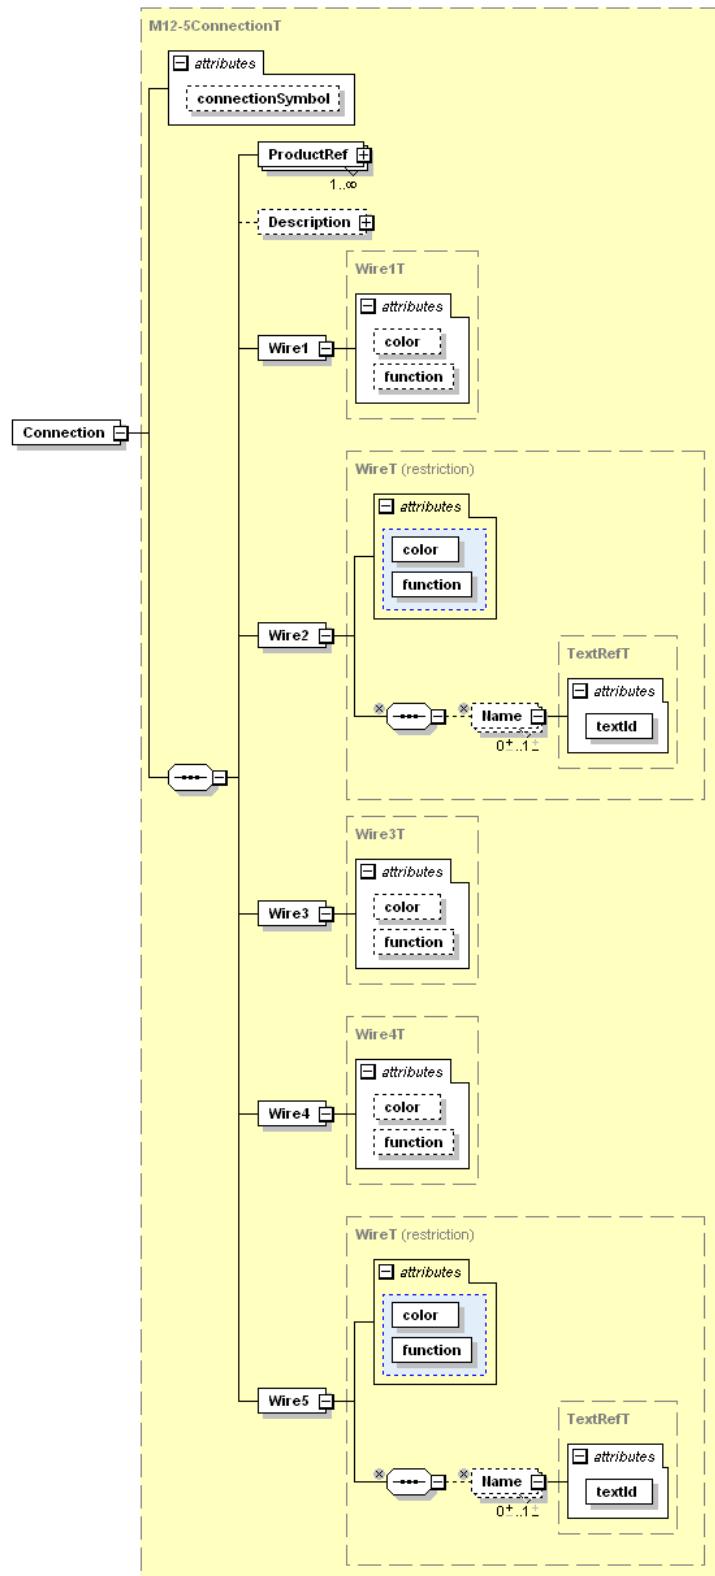

Figure 58 – Connection element – M5ConnectionT variant

2023 Wire1, Wire3 and Wire4 have fixed color and function. No Name is allowed.

2024 Wire 2 has a fixed color “WH” (white), and a function restricted to “NC” or “Other”. The function attribute is mandatory.

2026 **M8ConnectionT and M12-4ConnectionT**

2027 Same as M5ConnectionT.

2028 **M12-5ConnectionT**2029 The M12-5 connector as specified in IO-Link Interface and System Specification Version
2030 1.1.3, chapter 5.5.

2031

2032

Figure 59 – Connection element – M12-5ConnectionT variant

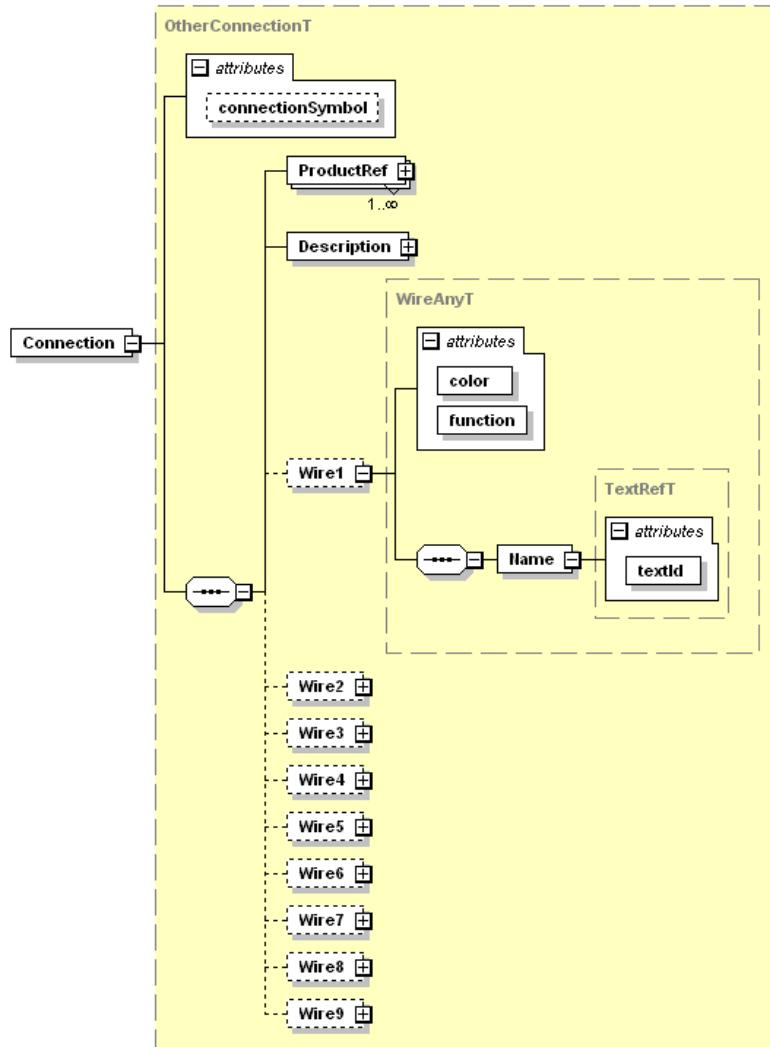

2033 Wire1, Wire3 and Wire4 have fixed color and function. No Name is allowed.

2034 Wire 2 has a function restricted to “NC”, “P24” or “Other”. If its function is I/Q, its color shall be
 2035 “WH” (white). The color and function attributes are mandatory.

2036 Wire 5 has a function restricted to “NC” or “N24”. The color and function attributes are
 2037 mandatory.

2038 **OtherConnectionT**

2039 Some non-standard connector.

2040

Figure 60 – Connection element – OtherConnectionT variant

2042 The Description is mandatory. For all given Wires, the element ‘Name’ and the attributes ‘color’
 2043 and ‘function’ are mandatory.

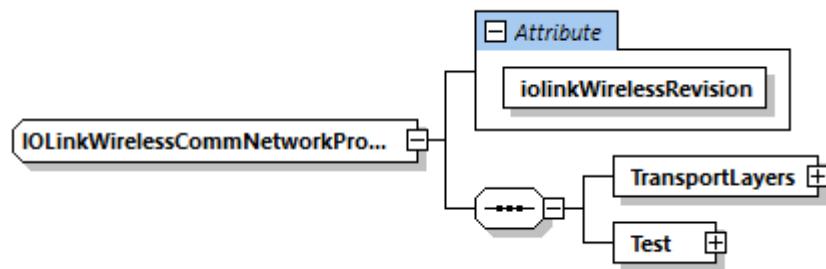

2044 Wires with functions “L+”, “L-” and “C/Q” shall be present.

2045 **CableConnectionT**

2046 Same as OtherConnectionT, but Description is not mandatory. The wire number in the
 2047 ‘Wire...’ element name does not designate a pin number here, but any arbitrary numbering of
 2048 the wires.

2049 **7.6.2 IOLinkWirelessCommNetworkProfileT**

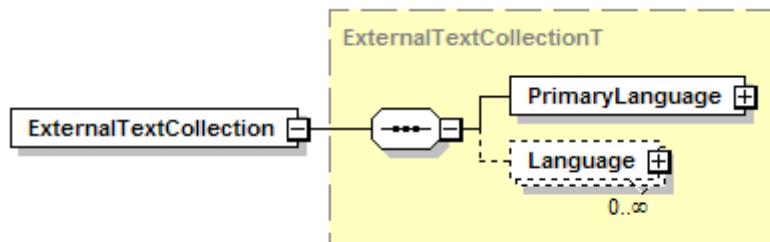

2050 For Wireless IO-Link, the following derived type IOLinkWirelessCommNetworkProfileT
 2051 describes the communication characteristics of a wireless IO-Link interface. Please see the
 2052 *IO-Link Wireless System Extensions Specification* for details of this communication network
 2053 profile.

2054

Figure 61 – CommNetworkProfile element – IO-Link Wireless variant**2056 7.7 Language dependent description texts**

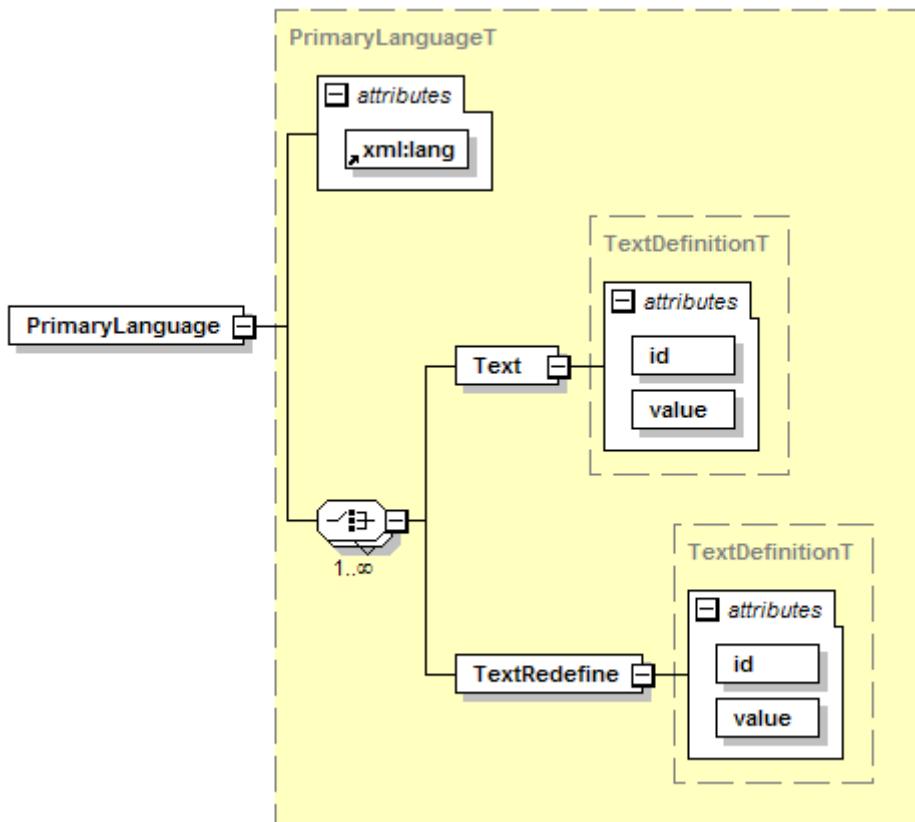

2057 All text components of the different languages are given in the ExternalTextCollection. There
2058 may be one or more languages deposited. Additional languages may be stored in separate files.

2059

Figure 62 – ExternalTextCollection element**2061 7.7.1 PrimaryLanguage (m)**

2062 Shall be in English.

2063

2064

Figure 63 – PrimaryLanguage element

2065 xml:lang (m, language)

2066 The code for the language according to ISO 639-1:2002. Shall be "en" for English.

2067 Text (m)

2068 Language dependent text which is referenced by its id.

2069 id (m, IdT)

2070 Shall be referenced by other elements via their 'textId' attribute (there shall be no unreferenced
2071 Text elements)

2072 value (m, string)

2073 Text in the denoted language.

2074 NOTE: Special characters shall be coded according to the XML syntax. See REC-xml-
2075 20081126, chapter 2.4 Character Data and Markup.

2076 & → &

2077 ' → ' (only required if inside a string enclosed in ' characters)

2078 > → >

2079 < → <

2080 " → " (only required if inside a string enclosed in " characters)

2081 LF → #10;

2082 Only the line feed is allowed for formatting the text.

2083 TextRedefine (o)

2084 Language dependent text which overrides a standard text. Only applicable for texts describing
2085 the octets of DirectParameter page 2.

2086 id (m, IdT)

2087 Shall be one of STD_TN_DeviceSpecific_1 to STD_TN_DeviceSpecific_16.

2088 value (m, string)

2089 Text in the denoted language. The Note at Text/@value also applies.

2090 7.7.2 Language (o)

2091 Optional specification of texts in another language. The attribute 'xml:lang' specifies the
2092 language (see ISO 639-1:2002). The structure of this element corresponds to the structure of
2093 the element PrimaryLanguage.

2094 8 Compatibility

2095 IO-Link devices conforming to the IO-Link Interface and System Specification Version 1.1.3.

2096 IO-Link devices conforming to the IO-Link Communication Specification Version 1.0 shall be
2097 described with an IODE according to the IO Device Description Specification Version 1.0.1 (or
2098 the legacy version 1.0).

2099 It is not possible to describe a V1.0 device with an IODE V1.1 or a V1.1 device with an IODE
2100 V1.0.1 or V1.0.

2101 Two IODEs having the same vendorId and deviceld, one being based on V1.0.1 (or V1.0) and
2102 the other being based on V1.1 are only allowed in the following use cases:

2103 • A V1.0 device exists and has a V1.0.1 (or V1.0) IODE. A new, compatible version of the
2104 device is built using the same vendorId and deviceld based on V1.1 needing a V1.1 IODE.

2105 • A V1.1 device is newly built with a new vendorId /deviceld pair. It is also V1.0 compatible
2106 and thus needs two IODEs.

2107 In both cases, the DeviceFamily and all DeviceVariant/Name (previously ProductName) for all
2108 languages, as well as all DeviceVariant/@productId shall be same.

2109 An IO-Link tool may show V1.1 as well as V1.0.1 (or V1.0) IODDs in its catalog. According
2110 compatibility feasibility of the IO-Link master, the appropriate IODD may be instantiated.

Annex A IODE schemas

The following schemas and standard definition files are part of this specification:

Schema files

- IODE1.1.xsd main IODE schema
- IODE-Primitives1.1.xsd basic definitions
- IODE-Datatypes1.1.xsd data types
- IODE-Events1.1.xsd events
- IODE-Variables1.1.xsd variables
- IODE-UserInterface1.1.xsd user interface
- IODE-Communication1.1.xsd communication network profile
- IODE-StandardDefinitions1.1.xsd main schema for the standard definition files
- IODE-WirelessCommunication1.1.xsd wireless communication network profile

Standard definition files

- IODE-StandardDefinitions1.1.xml list of standard variables, error types and events + english texts
- IODE-StandardDefinitions1.1-de.xml german texts
- IODE-StandardDefinitions1.1-es.xml spanish texts
- IODE-StandardDefinitions1.1-fr.xml french texts
- IODE-StandardDefinitions1.1-it.xml italian texts
- IODE-StandardDefinitions1.1-ja.xml japanese texts
- IODE-StandardDefinitions1.1-ko.xml korean texts
- IODE-StandardDefinitions1.1-pt.xml portuguese texts
- IODE-StandardDefinitions1.1-ru.xml russian texts
- IODE-StandardDefinitions1.1-zh.xml chinese texts
- IODE-StandardUnitDefinitions1.1.xml list of available unit codes + english texts

2137

Annex B Definitions of IODE quantity structure

2138 The following table lists limits on the number and the length of elements of the IODE. IODDs
 2139 shall not exceed these limits. IO-Link Tools shall accept all IODDs that do not exceed these
 2140 limits.

2141

Table 6 – IODE quantity structure

Element	Maximum Number/Length	Comments
Length of filename	255	
Number of DeviceVariants	255	
Number of ValueRanges	32	See note
Number of SingleValues	255	See note
Number of ProcessData Elements	16	
Number of Datatypes	255	See note
Number of Variables	1024	
Length of text which is referenced by DeviceVariant/Description/@textId in all languages	1024	Characters, not octets
For all others Description/@textId: Length of text which is referenced by Description/@textId in all languages	255	Characters, not octets
For all Name/@textId: Length of text which is referenced by Name/@textId in all languages	64	Characters, not octets
Length of URL which is referenced by VendorUrl/@textId in all languages	255	Characters, not octets
Length of @vendorName and all other texts referenced by a @textId (e.g. VendorText, DeviceName, DeviceFamily, ...)	64	Characters, not octets
Length of @productId value	64	Octets UTF-8 coded
Length of DocumentInfo/@copyright text	255	Characters, not octets
Number of Menus in MenuCollection	255	
Number of elements per menu (VariableRef+RecordItemRef+MenuRef)	64	
Variable/@id length	64	Characters, not octets
Datatype/@id length	64	Characters, not octets
@textId length	64	Characters, not octets
Number of supported languages	see ISO 639-1	Currently 185
Number of Menu Levels	3	

2142

2143 Note: The entries “Number of <element name>” are not meant as the total number of XML
 2144 elements with that name in the whole IODE. Instead, they are meant as “Number of XML
 2145 elements of that name within the superordinated element”.

2146

2147

2148

2149

2150

“Number of Datatypes” is the number of Datatype elements within the DatatypeCollection element. This does not constitute the total number of data types which may appear in an IODE, because each Variable and ProcessDataIn/ProcessDataOut element may additionally use an embedded data type.

2151 "Number of Variables" is the sum over all StdVariableRef, DirectParameterOverlay and
2152 Variable elements within the VariableCollection.
2153
2154

Annex C IODE test (normative)

2155 1.1 General

2157 An IODE shall conform to the underlying schema files and a set of business rules, defined in
2158 this specification.

2159 1.2 Schema test via an IODE Checker tool

2160 The IO-Link Community provides the IODE Checker for download free of charge from its web
2161 site. It is mandatory for each IODE associated with a Device to pass the test with this Checker.
2162 The Device's manufacturer declaration shall state the successful result of the test.

2163 The latest released version of the IODE Checker shall be applied, when new device Id has been
2164 specified.

2165 The requirements for the Checker consist of two main parts.

2166 Within the first part the Checker uses the following parsers or their later versions or alternatives
2167 where applicable to test the schema consistency of a particular IODE:

- 2168 • XmlReader class of Microsoft .NET Framework Version 2.0 with schema validation
2169 switched on, i.e. *Settings.ValidationType* set to *ValidationType.Schema*.

2170 Microsoft .NET Framework Version 2.0 Redistributable Package,
2171 date published: 22-Jan-2006,
2172 <http://www.microsoft.com/downloads/details.aspx?familyid=0856EACB-4362-4B0D-8EDD-AAB15C5E04F5&displaylang=en>

2176 Microsoft .NET Framework 2.0 Service Pack 2
2177 date published: 16-Jan-2009,
2178 <http://www.microsoft.com/downloads/details.aspx?FamilyID=5b2c0358-915b-4eb5-9b1d-10e506da9d0f&displaylang=en>

- 2180 • Xerces-C++ Version 3.1.1,
<http://xerces.apache.org/xerces-c/>

2182 Within the second part the Checker uses the following business rule set in Table 7.

2183 Column 'Reference' indicates either the chapter within this document or with prefix [1] the
2184 chapter within the IO-Link Interface and System Specification Version 1.1.3.

2185 An "X" in column "M" indicates relevance for the main IODE

2186 An "X" in column "L" indicates relevance for the language file.

2187 An "X" in column "W" indicates that this business rule check creates a warning.

2188 An "X" in column "H" indicates 'highly recommendation'. Checker creates a warning, which
2189 cannot be disabled or made invisible.

2190 An "X" in column "V" indicates validity of the check for legacy Devices (V1.0).

2191

2192 **Table 7 – Checker business rule set for IODEs**

IODE_TC No	Rule name	Reference	Definition	M	L	W	H	V
0001	Encoding	5	Encoding shall be UTF-8	X	X			X
0002	NameSpace	5	http://www.w3.org/2001/XMLSchema-instance with the prefix "xsi" http://www.io-link.com/IODE/2010/10 with the prefix "iodd"	X	X			

IODE_TC_No	Rule name	Reference	Definition	M	L	W	H	V
0003	AdditionalNameSpaces	5	No additional name spaces shall be included	X	X			X
0004	SchemaLocation	5	http://www.io-link.com/IODE/2010/10	X	X			
0005	SchemaMainIODE	5	IODE1.1.xsd	X				
0006	SchemaLanguageFile	5	IODE-Primitives1.1.xsd		X			
0007	FileNameConvention - IODE SpecialCharacters	5	Special characters are permitted in vendor name and device name part of filename: _, #, -	X	X			X
0008	FileNameConvention IODE- VendorNamePart	5	All files of the set of files belonging to a specific IODE shall have the same <vendor name> part in their file names.	X	X			X
0009	FileNameConvention MainIODE	5.1	<vendor name>-<device name>-<date of file creation>-IODE<schema version>.xml; IODE shall be done with upper case letters	X				X
0010	FileNameConvention LanguageFile	5.2	<vendor name>-<device name>-<date of file creation>-IODE<schema version>-<language>.xml; IODE shall be done with upper case letter		X			X
0011	LanguagePart - LanguageFileName- ISO	5.2	The "language" part follows ISO 639-1:2002.		X	X		X
0012	LanguagePart – LanguageFileName- 2Letters	5.2	The "language" part consists of two letters		X			X
0013	LanguagePart – LanguageFileName- Unique	5.2	There shall be no additional language file for languages already covered in the main IODE file		X			X
0014	LanguagePart – LanguageFileName- Inside	5.2	The language part of the language file name shall be the same as the definition inside the language file		X			X
0015	LanguageStandard- Definitions	5.2	If an IODE contains a language, which is not existing for IODE-StandardDefinitions, the checker will show a warning	X	X	X		
0016	VendorLogo	5.3	160 x 90 pixel, landscape format	X				X
0017	DeviceIcon	5.3	48 x 48 pixel	X				X
0018	DevicePicture	5.3	Min. 160 x 160 pixel, max. 320 x 320, square	X				X
0019	ConnectionSymbol	5.3	Min. 160 x 160 pixel, max. 320 x 320, square	X				
0020	ImageFilesExist	5.3	If the attributes are used, the referenced image files shall be present	X				X
0021	ImageFileNameConvention	5	All files of the set of files belonging to a specific IODE shall have the same <vendor name> part in their file names	X				X
0022	DateIODE - FileName	7.3.1	The date information in the IODE file name shall correspond to the releaseDate attribute in the DocumentInfo element	X				X
0023	DateLanguage - FileName	7.3.1	The date information in the language file name shall correspond to the releaseDate attribute in the DocumentInfo element, if the DocumentInfo element exists		X			X
0024	ProfileHeader	7.3.2	It shall correspond exactly to the given values in the specification	X				X

IODE_TC No	Rule name	Reference	Definition	M	L	W	H	V
0025	Stamp	7.3.4	If no errors are detected during the checking process, the crc attribute is set to a CRC value calculated across the file contents. Otherwise, the crc attribute is set to an invalid value.	X	X			X
0026	Comments - InOr-AfterStamp	7.3.4	Comments shall not be included in or after the Stamp element.	X	X			X
0027	ProductId	7.4.1	ProductId in IODE corresponds to the ISDU standard parameter. Multiple device variants are only allowed, if StdVariableRef with id="V_ProductID" is present.	X				X
0028	ProductId-Length	7.4.1	The maximum length of ProductId shall not exceed 64 octets UTF-8 coded.	X				X
0029	Declarations-Data-types	7.5.2	There shall be no unreferenced data type elements.	X				X
0030	DatatypeId	7.5.2	For data types in the DatatypeCollection, the attribute id shall be specified.	X				X
0031	NoDatatypeId	7.5.2	For Datatypes outside the DatatypeCollection, the attribute id shall not be specified	X				X
0032	StdVariableRef	7.5.4.1	V_DirectParameters_1 shall always be referenced. All standard ISDU variables marked with the attribute mandatory="true" in the IODE-StandardDefinitions shall be referenced, if the Device supports ISDU access.	X				X
0033	V_DirectParameters_2 and DirectParameterOverlay	7.5.4.1	StdVariableRef with id="V_DirectParameters_2" and DirectParameterOverlay may only be present both or none.	X				
0034	DirectParameterOverlay reference in menu	7.5.4.1	If StdVariableRef with id="V_DirectParameters_2" and DirectParameterOverlay are present, V_DirectParameters_2 shall not be referenced and DirectParameterOverlay shall be referenced in menu.	X				
0035	StdVariableRef - ReservedIds	7.5.4.2 7.5.4.3 [9], B.2.1	The id of any standard variable shall not be used as id for the Variable or DirectParameterOverlay, even if the standard variable is not referenced from this IODE.	X				X
0036	StdVariableRef - DefaultValue	7.5.4.1	@defaultValue shall not be specified for references to V_ProcessDataInput or V_ProcessDataOutput	X				X
0037	FixedLength-Restriction	7.5.4.1	If referenced variable is of type OctetString or String, it shall be less or equal its fixedLength attribute. If referenced variable is of type Array, it shall be less or equal to its count attribute.	X				X
0038	V_Application-SpecificTag	[1], B.2.16	If fixedLengthRestriction is used, it shall be equal or greater than 16.	X				X
0039	StdSingleValueRef	7.5.4.1	Check if StdSingleValue exists as SingleValue in StdDefinitions1.1.xml.	X				X
0040	StdValueRangeRef	7.5.4.1	Check if StdValueRange exists as ValueRange in StdDefinitions1.1.xml.	X				X
0041	StdVariableRef - SingleValue	7.5.4.1	Check against overlapping with StdSingleValue and StdValueRange (even if they are optional and not referenced), other SingleValue or ValueRange.	X				X

IODE_TC No	Rule name	Reference	Definition	M	L	W	H	V
0042	StdVariableRef - ValueRange	7.5.4.1	Check against overlapping with StdSingleValue and StdValueRange (even if they are optional and not referenced), other SingleValue or ValueRange.	X				X
0043	StdRecordItemRef	7.5.4.1	Check if referenced RecordItem exists in StdDefinitions1.1.xml.	X				X
0044	DirectParameter-Overlay - Subindex-AccessSupported	7.5.3.2.3 [1], B.1.1	Statement subindexAccessSupported="false" shall not be used. Index 1 can only be accessed octet by octet.	X				
0045	DirectParameter-Overlay - Datatype	7.5.4.2	The data type shall be a record.	X				
0046	DirectParameter-Overlay - Usage	7.5.4.1	It is highly recommended not to use V_DirectParameters_2 and ISDU in the same Device.	X	X	X		
0047	VariableIndex	[1] B.2.1	Preferred and extended Index for Device or vendor specific variables are 64 to 254 and 256 to 16383. Indices 2 to 63, 255, 16384 to 65535 shall not be used as Device or vendor specific variable.	X				X
0048	VariableIndex - Profiles and extensions	[1] B.2.1	If indices from ranges reserved for profiles and extensions are used, the checker shall generate a warning.	X	X			X
0049	RecordItemInfo	7.5.4.3	RecordItem shall exist.	X				X
0050	RecordItemInfo - NoRecord	7.5.4.3	Only applicable if the variable is of type record.	X				X
0051	DefaultValue	7.5.4.1 7.5.4.3	The default value shall match the given datatype.	X				X
0052	DefaultValue - String	7.5.4.1 7.5.4.3	Check whether used letters are valid in respect to given encoding.	X				X
0053	ProcessData - Condition	7.5.5	If ProcessData occur more than once, the individual ProcessData elements shall be distinguished by the Condition element.	X				X
0054	ProcessData - BitLength	7.5.5	The attribute 'bitLength' shall represent the underlying ProcessDataIn (-Out) datatype in a bit by bit manner. For record data types this bitLength shall equal the bitLength attribute of the record.	X				X
0055	ProcessData - ConditionVariable	7.5.5	There shall only be exactly one variable used for the switching of process data. The referenced variable shall contain a default value. The process data length (of ProcessDataIn and ProcessDataOut respectively) shall be the same for all ProcessData.	X				X
0056	ProcessData - ConditionDatatype	7.5.5	Conditions shall only be of datatype IntegerT, UIntegerT and BooleanT.	X				X
0057	ProcessData - Condition – Menu	7.5.5	All Variable / RecordItem referenced in the ProcessData/Condition elements shall be referenced from at least one menu within each user role.	X				
0058	StdErrorTypeRef	7.5.6	Check whether referenced ErrorType exists in StdDefinitions1.1.xml.	X				
0059	StdEventRef	7.5.7	Check whether referenced Event exists in StdDefinitions1.1.xml.	X				
0060	EventCode	[1], D.2	Vendor or device specific codes are: 0x1800-0x18FF and 0x8CA0-0x8DFF.	X				

IODE_TC No	Rule name	Reference	Definition	M	L	W	H	V
0061	EventCode – Profiles and extensions	[1], D.2	If EventCodes from ranges reserved for profiles and extensions are used, the checker shall generate a warning.	X		X		
0062	ProcessDataInfo	7.5.8.1	Check whether displayFormat and Datatype are matching.	X				
0063	MenuLevel	7.5.8.2	At most three menu levels below the role assignment are acceptable.	X				X
0064	NotUsedMenus	7.5.8.3	There shall be no unreferenced Menu elements	X				
0065	MenuName	7.5.8.3	For underlying menus, a menu name shall be specified.	X				X
0066	GradientOffset	7.5.8.4	When applying gradient and/or offset to convert the Variable or RecordItem value into the displayed value, the value will be implicitly converted to a floating-point value. Consequently, the only allowed displayFormat for such values shall be "Dec" or "Dec.*".	X				X
0067	RecordItemRef - Array	7.5.8.4	Single array members cannot be referenced by RecordItemRef.	X				X
0068	UnitCode	7.5.8.4	Unit code to which the indicated variable refers. See IODE-StandardUnitDefinitions1.1.xml for valid unit codes.	X				X
0069	Menu - AccessRightRestriction	7.5.8.4	The accessRight of the referenced element shall include the accessRights given by accessRightRestriction.	X				X
0070	ButtonValue	7.5.8.4	The value of the 'buttonValue' attribute shall be defined as a 'SingleValue' of the Variable/-RecordItem	X				X
0071	ButtonValue - Datatype	7.5.8.4	It is highly recommended to use data type UIntegerT with bitLength="8"	X	X	X		
0072	ButtonReference	7.5.8.4	A variable referenced as "Button" shall have accessRights "wo", shall only be displayed as a button, and shall not be used as a condition variable to switch menus or processdata.	X				X
0073	RecordItemRef	7.5.8.5	The variable referenced by variableId shall be of type record. The subindex shall be defined in the referenced record.	X				X
0074	RecordItemRef - Button	7.5.8.5	If referenced as "Button", the referenced variable shall support subindex access.	X				X
0075	Button - NoDisplay-Format	7.5.8.5	If in menu subelement 'Button' exists for VariableRef or RecordItemRef, the attributes 'gradient', 'offset', 'unitCode' and 'displayFormat' shall not be used.	X				
0076	MenuRef - CircularReferences	7.5.8.6	Circular references to menus are not allowed.	X				X
0077	MenuCondition	7.5.8.6	Conditions shall only be of datatype IntegerT, UIntegerT, and BooleanT.	X				X
0078	MenuCondition - ProcessDataCondition	7.5.8.6	If there is more than one ProcessData element selected by conditions, and the variable V_ProcessDataIn or V_ProcessDataOut is referenced in a menu, one of the following shall hold: a) The type of reference (VariableRef/-RecordItemRef) and the gradient, offset,	X				X

IODE_TC No	Rule name	Reference	Definition	M	L	W	H	V
			unitCode and displayFormat match each of the ProcessData elements. b) The menu is conditioned in the same way as one of the ProcessData elements, and the type of reference (VariableRef / RecordItemRef) and the gradient, offset, unitCode and displayFormat match this particular ProcessData element ("conditioned in the same way" means that this menu or one of the parent menus has the same condition: same variable, same subindex, same value).					
0079	MinCycleTime	7.6 [1], B.1.3	The minimum cycle time of the device; specified in units of 1 µs. For example, 2300 represents 2,3 ms.	X				X
0080	PrimaryLanguage	7.7.1	The primary language shall be English (the attribute xml:lang shall have the value "en").	X				X
0081	TextRedefine	7.7.1	Language dependent text overriding a standard text. Only applicable for texts describing the octets of DirectParameter page 2. It shall be one of STD_TN_DeviceSpecific_1 to STD_TN_DeviceSpecific_16.	X				
0082	NotUsedTexts	7.7.1	There shall be no unreferenced Text elements.	X	X			X
0083	NotTranslatedTexts	7.7.1	Check whether texts are not translated.	X	X	X		X
0084	UniqueDeviceVariant - NameText	7.4.1	Texts referenced by DeviceVariantCollection/DeviceVariant/Name/extId shall be unique within each supported language.	X	X			
0085	UniqueVariable - NameText	7.5.4	Texts referenced by StandardVariables, DirectParameterOverlay or Variables shall be unique within each supported language.	X	X			
0086	OverlappingSingle-Value - ValueRange	7.5.3.1.1	SingleValues and ValueRanges shall not overlap	X				X
0087	Arrays	[1], F.2.3 [1], F.2.4	UIntegerT and IntegerT with a length of ≥ 58 bit and < 64 bit are not permitted.	X				X
0088	Array Alignment	7.5.3.2.2	Array elements with bitLength < 8 bit shall not cross octet boundaries. For array elements with bitLength >= 8 bit use bitLength as multiples of 8 bit.	X				
0089	Record - Subindices	[1], F.3.3	The Subindices within the IODE shall be listed in ascending order from 1 to n describing an octet sequence. Gaps within the list of Subindices are allowed.	X				X
0090	RecordItems - Alignment Data-types	[1], F.3.3	The following data types shall always be aligned with octet boundaries: Float32T, StringT, OctetStringT, TimeT, and TimeSpanT.	X				X
0091	RecordItems - Alignment - Integer58	[1], F.3.3	UIntegerT and IntegerT with a length of ≥ 58 bit shall always be aligned with one side of an octet boundary.	X				X
0092	RecordItems – Alignment - Integer10	[1], F.3.3	It is highly recommended for UIntegerT and IntegerT with a length of ≥ 8 bit to align always with one side of an octet boundary.	X	X			X
0093	RecordItems - Alignment - Integer6	[1], F.3.3	It is highly recommended for UIntegerT and IntegerT with a length of < 8 bit not to cross octet boundaries.	X	X			X

IODE_TC No	Rule name	Reference	Definition	M	L	W	H	V
0094	RecordItems - Alignment - Integer	7.5.3.2.3	For variables, UIntegerT and IntegerT shall begin on an octet boundary.	X				
0095	RecordItems - Alignment - Boolean	7.5.3.2.3	For variables, it is highly recommended to group BooleanT together into one or few octets.	X		X	X	
0096	RecordItems - AccessRightRestriction	7.5.3.2.3	The accessRightRestriction of the RecordItem shall include the accessRights of the variable.	X				X
0097	ProcessData - AccessRightRestriction	7.5.3.2.3	The attribute "accessRightRestriction" is only applicable for ISDU parameter, not for RecordItem for process data.	X				X
0098	BitOffset	[1], F.3.3	RecordItem shall not overlap	X				X
0099	Connection - MinDef	7.6	Connection: If OtherConnectionT is used, there shall be wires with the function L+, L- and C/Q.	X				
0100	MaxLength – Variables	[1], 4.4	The length of a variable shall not exceed 232 octets.	X				X
0101	MaxLength - ProcessData	[1], 4.4	The length of a ProcessDataIn/Out shall not exceed 32 octets.	X				X
0102	ExcludedFromData Storage	7.5.4.1	This attribute may only be set to "true" for variables with accessRights = "rw".	X				
0103	ModifiesOtherVariables	7.5.4.2	This attribute may only be set to "true" for variables with accessRights = "rw" or "wo".	X				
0104	Dynamic	7.5.4.2	This attribute may only be set to "true" for variables with accessRights = "rw" or "ro".	X				X
0105	Quantity	B	Quantities shall not be exceeded	X	X			
0106	DeviceAccessLocks - RecordItemRef	7.5.8.4	V_DeviceAccessLocks shall only be referenced via RecordItemRef.	X				
0107	DeviceAccessLocks - Features	7.5.8.5	A RecordItemRef with variableId="V_DeviceAccessLocks" is only allowed for those subindices which refer to an access lock that is supported, i.e. where the respective attribute in Features/SupportedAccessLocks is set to "true".	X				
0108	Features – DataStorage - DevSpecISDU	7.5.1	If attribute Features/@dataStorage = "false" and Device specific ISDU variables with accessRights = "rw" are present, issue a warning: "Warning: Support of Data storage is highly recommended" Result: Warning	X		X	X	
0109	Features – DataStorage - StdISDU	7.5.1	If attribute Features/@dataStorage = "false", all Standard Variables with accessRights = "rw" shall not be implemented. (StdVariableRef to V_ApplicationSpecificTag, V_DeviceAccessLocks, V_OffsetTime) Result: Error	X				
0110	Variable - StdVariableRef	7.5.4.1	For a StdVariableRef to V_DeviceAccessLocks, StdRecordItemRef elements may only be present for supported access locks. Supported means, that the corresponding attribute in Features/SupportedAccessLocks is set to "true".	X				

IODE_TC No	Rule name	Reference	Definition	M	L	W	H	V
0111	Variable - StdVariableRef-ProductID_1	7.5.4.1	If there is only one DeviceVariant present, the value of DeviceVariant/@productId shall be used as default value of V_ProductID.	X				
0112	Variable - StdVariableRef-ProductID_2	7.5.4.1	For references to V_ProductID the attribute 'defaultValue' shall not be specified if more than one DeviceVariant is defined.	X				
0113	Menu - VariableRef	7.5.8.4	For VariableRef, the attribute accessRightRestriction shall not be set to "wo".	X				
0114	Menu - RecordItemRef	7.5.8.5	For RecordItemRef, the attribute accessRightRestriction shall not be set to "wo".	X				
0115	Variables - ComplexDatatypes-accessRights	7.5.4.3	For records and arrays the attribute accessRights="wo" is not permitted.	X				
0116	Variables – Record-RecordItem	7.5.3.2.3	The attribute accessRightRestriction shall not be set to "wo". An exception to this rule is the V_DirectParameters_1.	X				
0117	PhysicalLayer - mSequenceCapability	[1], A.2.6	Checker shall warn if M-Sequence value leads to Type_0. Checker shall use following text: "Warning – It is highly recommended for Devices not to use TYPE_0 in Preoperate or Operate states"	X	X	X		
0118	VariableRef – Button - ActionStartedMessage	7.5.8.4	ActionStartedMessages shall be omitted for buttons referencing StdSingleValueRefs [@id="128" or "129" or "130" or "131"].	X	X			
0119	VariableRef – Button - Description	7.5.8.4	For button values described as StdSingleValueRefs [@id="128" or "129" or "130" or "131"], the Description element is mandatory. The definition in template IODE-SystemCommandDefinitions_V113.xml shall be used. Checker shall check IODE for correct content of button description within each supported language.	X	X			
0120	SupportedAccessLocks - Parameter	7.5.1 [1] B.2.4	It is highly recommended, that Features/SupportedAccessLocks/@parameter is set to "false".	X		X	X	
0121	SupportedAccessLocks - dataStorage	7.5.1 [1] B.2.4	It is highly recommended, that Features/SupportedAccessLocks/@dataStorage is set to "false".	X		X	X	
0122	RecordItemRef – DeviceAccessLocks - Parameter	7.5.1	IODE Menu shall not contain reference to V_DeviceAccessLocks subindex="1"	X				
0123	RecordItemRef – DeviceAccessLocks - DataStorage	7.5.1	IODE Menu shall not contain reference to V_DeviceAccessLocks subindex="2"	X
